WILL AND BEES.

My grandpa is the greatest man in
all the world, I bet,
And all his hair has turned as white
as it can ever get;
But one day, when they didn't know
that I was there, I guess,
My grandma called my grandpa Will
and he called grandma Bess.

My grandpa's kind of tall, and once
he held me on his knee
And said I was the kind of boy my
father used to be;
And then he laughed and grandma
cried—I don't know why she
should,
Because my father hasn't died, and
his health's awful good.

My grandpa's very old and seems to
know most everything,
And people bow to him so low you'd
think he was a king;
But something funny happened once;
I think about it still—
My grandpa called my grandma Bess
and she called grandpa Will.

THE STORY OF THE ONE CENT LADY.

At the junction of Union Square and one of the cross streets leading out of it there is a fruit stand kept by two Italians—one thin and dark and bent, the other plump and red-cheeked and blue-eyed, although his hair is black.

Every evening about 6 o'clock a frail little old lady, with tiny clusters of veins like seaweed about her temples and little rosettes of wrinkles about her soft brown eyes, used to stop at the fruit stand on her way home from the publishing house on the opposite side of the square. It was always from the "one cent each" tray that she purchased, and so after a while she came to be known to the fruit partners as "da one cent lady." She had a ready smile and a quaint, old-fashioned courtesy that was not kept for special occasions, and the Italians had learned to watch for her and to miss her when she did not appear.

Long before her hair had whitened and her eyes dimmed the One Cent Lady had begun to work for the firm across the square, clipping book notes from the newspapers and magazines. And the firm had let her stay on during these last years, although she had ceased to be af any actual service to them. Her salary had never been large, and its capacities seemed to shrink with her increasing frailties. More than once she had gone a block out of her way on her homeward journey so as not to pass the corner of temptation, for fruit was the one indulgence she allowed herself.

On the occasion of one of these periods of disappearance, which had lasted for several days, the keepers of the fruit stand consulted together with much lifting of eyebrows and shrugging of shoulders. It might even be that she was ill. At last the thin one took down a paper bag, several sizes larger than the one usually required for her purchases, and filled it from the "two for 5" division in his display, putting a 5-cent orange on the top.

The red-cheeked one took it across the avenue to the dingy-faced house where she lived, and not knowing her name, left it for the "ol' lady—pretty lady—ane one cent a lady."

Somehow it reached her, and although the two men waived all responsibility in the matter, and stoutly refused payment, still the lonely lady knew the truth in her heart. Stray papers and magazines began to find their way to the fruit stand—papers from "we-a home, Papoli," among them. There were few words on either side; those who live life close to the bone have less need of speech, but month after month there grew a simple understanding that would not shame the name of friendship.

One afternoon in late July the One Cent Lady, crossing the hot, flagged walks of the square, suddenly felt too weary to go on. There was one vacant bench left on the shady side of the circle, and she sat down limply on it. The city, like a great hour-glass turned, was pouring its busy crowds back into their homes. But the One Cent Lady sat quite still, her eyes on the dancing fountain. The red-cheeked man watched her for some time, then went over to her.

"This is very good of you," she said slowly, and almost as if she had been expecting him. "Will you help me home?"

The next day she did not come—nor the next. On the third day, with a troubled face, the tain, bent man put on his coat, and carefully brushing his cap with his sleeve, set off down the street with a bag of his best grapes.

But she would not need them, they told him kindly at the door; she had died that morning. Was he the fruit stand man? She had left a little parcel addressed to him; they would get it for him if he would wait?

He waited, speechless, his cap in one hand, his grapes in the other. When, on his return to the fruit stand, the two, with reverent hands, opened the package, they sat down and cried like children. It held a small Neapolitan watercolor—the sole ornament of its owner's room—and a slip of paper with the words, "For the two friends who helped to brighten my days."

No more fruit was sold that day. Instead, more than a week's earnings went for the purchase of a great armful of snowy roses—roses such as were rarely seen in the dingy-faced house where the One Cent Lady lay, as still and almost as white as they.

The little bit of color that was her gift hangs, framed and protected, inside the fruit stand at the corner, where passersby who, seeing only the surface of things, still call this big city of theirs a cold and heartless place.—Esther Harlan in Youth's Companion.

SELLING BY APPEARANCE.

Is your place for sale? If so, have you done anything to make it more attractive in the eyes of the prospective buyer?

Many a farm has been placed upon the market for disposition and sold at a price that could have been greatly enhanced had the seller touched it up here and there. Also, there are farms that have not been sold, for the reason that they were permitted to remain in a state of semi-decay—visual evidence to the buyer, as he sees conditions, that the place may have been unproductive.

Question of Soil.

Naturally, the first consideration of the purchaser of a farm is the question of soil. To that he gives immediate attention; but also does he cast his glance about the environments. If he finds the fences down here and there, or sagging badly; should he notice piles of refuse thrown into odd places; were he to discover rotten timbers in the outbuildings, he would give due heed. Should the house be devoid of paint and sadly in need of repairs, it would add to his calculations of the deductions he would make in his offer, supposing he considered the land worth a purchase.

The Weak Spots.

Are the weeds triumphant everywhere and would it not materially add to the looks of things to kill them? Is the farm machinery in order; has it been safely housed from the destructive weather elements, cleaned and bearing evidences of care? Is the pump, or the windmill, in good condition, together with the countless incidentals that show wear and tear?

Dressing up a farm for sale requires no specially onerous or expensive outlay of time or money, compared with the net returns that would come from a smart and attractive appearance of the property. Your profits will be magnified if your place has an enterprising, snappy look; while inversely, should the farm bear the hallmarks of carelessness and disintegration you stand the chance of a prospect passing by or otherwise making you an offer not approximating the value you have placed upon the farm.

The best looking farm brings the highest price in the market, and as it is a matter of dollars and cents it would seem to be a good business stroke to put a salable property in the very best condition for the benefit of a prospective purchaser.

SALT'S MANY QUALITIES.

Besides being an esesntial part of the culinary art, salt has many other uses perhaps not generally known. Salt cleanses the palate and furred tongue, and a gargle of salt and water is often efficacious. A pinch of salt on the tongue, followed ten minutes after by a drink of cold water, often cures the ick headache. Salt hardens the gums, makes the teeth white and sweetens the breath. Salt added to the water in which cut flowers stand keeps them fresh. Salt used dry in the same manner as snuff will do much to relieve colds, hay fever, etc. Salt in warm water, if used for bathing tired eyes, will be found very refreshing. Salt and water will stop hemorrhage from tooth extraction.

RHYMED RECIPES.

Orange Compote.

Take oranges of medium size,
The peel remove I pray;
From each a round cut from one end
And scoop the seeds away.

Fill up the little cups thus formed
With strawberry-preserve—
That flavor mixed with orange-juice
Is more than most deserve.

Then top each orange with whipped cream,
A cap all soft and white,
Made up of puffs, while for rosettes
The strawberries gleam bright.

On separate plates the fruit then serve
With lady-fingers slim
And I've no doubt a king would say,
The dish was fit for him!

Butter-Scotch.

One cup of sugar—brown, not white—
One half of water clear,
One teaspoonful of vinegar
(In candy—oh! how queer),
A piece of butter, walnut size,
Add flav'ring to your taste;
Now boil some twenty minutes, say,
Then take it off with haste.

Chocolate Caramels.

One cup of sugar, one, also,
Molasses-filled and one of milk,
Small spoon of butter—these, you know,
With chocolate, grated fine as silk
(Unsweetened, too, a quarter pound),
Are creamed by stirring 'round and 'round.

This mixture's boiled until it's done
(Cracking in water proves that true),
Then into buttered pans it's run,
Inch-thick or even less will do;
Now one thing more and all is told—
Mark off in squares when nearly cold.
—Woman's Home Companion.

THE DECAY OF MANNERS.

Thomas Nelson Page writes in the April Century "On the Decay of Manners"—manners which are the hallmarks of "that life of quality, the foundation of which is good breeding, the native air of which is refinement, and the membership of which are all gentlefolk the world over." Here are some of his points:

"The bloom on the ripened fruit of civilization, and the proof of its perfection, is delicacy."

"Whatsoever the form may be, and there are many forms in which good breeding may present itself—as many, indeed, as are the incidents of social intercourse—whatever tends to put at ease the person one meets is good manners, and whatever tends to the opposite is rudeness."

"Whoever takes advantage of another we know cannot be a gentleman, for the first word of the law of good breeding, as the last, is kindness. The Golden Rule contains the last word of manners, as it does on most other laws of living."

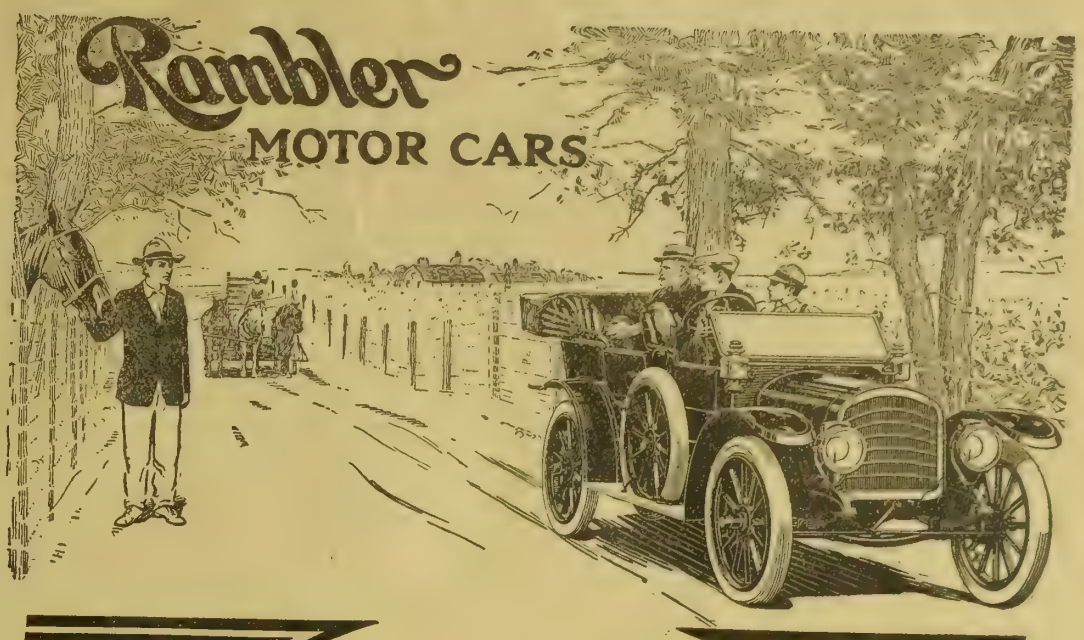
"The express train and the 'crush-hour' are in many ways great advantages, but they are not conducive to good manners.

"To revive ancient good breeding and bring back the old-time manners, it is necessary to set aside money as the chief foundation of respect, and to set up once more the ideals of courtesy and kindly conduct.

"Women make both the manners and the morals of the people. Neither rises higher than the gage which women set in a community."

"If those who are gentlefolk—who possess the rare, but often unprized, treasures of refinement, culture, taste, and high ideals of living and thinking, would scrupulously hold themselves above pandering to vulgarity simply because if has wealth behind it, a society would soon be formed which would have not only the stamp of good breeding, but, as possessing the thing itself, would have the authority and power to dictate its own terms."

A fore-handed man is much better than a three-handed one. I never heard of a three-handed man. Well, Cubbage is one. He's a right hand, a left hand, and a little behind hand.—New York Sun.



Rambler
Sixty-three

A FINE motor car, like a fine horse, shows its class or pedigree in its lines, its grace, and its performance. Thousands of farm owners in every section of the country have testified to the service of the Rambler. Certain features, they agree, are essential in a car for use on country roads. Their experience proves that these are not mere talking points. Rambler big wheels and tires, long wheel base, shock absorbers, seven-eighths elliptic springs, fine upholstering and the adjustable steering pillar are for comfort. The safety cranking device, extra large brakes, and parts made with greater strength than will ever be required, are for safety. The offset crank shaft is for taking the hills and deep sand easily, without rushing, and traveling slowly in high gear behind a loaded wagon on a narrow road or in crowded traffic. Investigate the Rambler before you decide to buy.

Learn of the experience of other farm owners with this car. They tell it in picture and story in the Farm Owners' Number of the Rambler Magazine, which will be sent free for the asking.

Dark comb	12@12½
Extracted white	8
Extracted dark	6½
Beeswax, lb	24@30

Hay.

Scott, Magner and Miller say:

Arrivals of hay for the past week have amounted to 2935 tons, an increase of 50 per cent over last week's arrivals, which were 1927 tons. These receipts consisted chiefly of the medium and poorer grades, which have moved off slowly. A few cars of fancy which have arrived have sold at 50 per cent above our top quotations, but it is so seldom that a fancy car is in evidence that it is hardly quotable. Fancy red oat hay would also bring in excess of our top quotations were it available.

Considerable buying of old crop is reported from country districts at prices at which it could not be handled on this market at the present time, buyers evident figuring on holding same for a raise in the market which is extremely dangerous at this time of year, as crop conditions are daily reported better owing to the cool weather which has continued throughout the week, and we now believe that our new crop will be much larger than many figured a few weeks ago, in which case we do not look for any advance in the present market. Reports state that cutting of hay is becoming general in the San Joaquin Valley district, and that new hay will probably be shipped to this market within the next ten days. This, of course, will have its effect on prices of old hay.

There is practically no movement of alfalfa hay.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	13.50@14.50
No. 1 wheat or wheat & oat	11.00@12.00
No. 2 wheat or wheat & oat	10.00@11.00
Choice tame oat	10.00@12.50
Other tame oat	8.50@10.50
Wild oat	9.00@10.00
Stock hay	6.00@8.00
Alfalfa	9.00@10.50
Straw, bale	40@50

Grain.

Barley, fancy	1.50@1.51¼
Barley, good to choice	1.45@1.48¾
Barley, poor to fair	1.40@1.45
Oats, white	1.50@1.60
Rye, new crop	1.40@1.50
Alfalfa seed	18@20
Mustard, brown	4½
Millet	2¾
Flaxseed	5@5½
Broom corn seed, ton	23.50

Feed Stuff.

Alfalfa meal	17.00
Bran, ton	28.00@29.00
Feed cornmeal, ton	33.00@34.00
Cracked corn	33.00@34.00
Rolled barley, ton	32.00@33.50
Rolled oats, ton	29.00@30.00
Middlings	33.00@35.00
Oil cake, ton	40.00@41.50
Cocoanut cake, ton	25.50@26.50
Mixed feed, ton	25.00@27.00
Shorts	29.50@30.00

"I cannot understand ze Engleeshe language," said the desperate Frenchman. "I learn how to pronounce ze word 'hydrophobia,' and zen I learn zat ze doctors pronounce it 'fatal.'"—Tit-Bits.

Make the most uv ev'rything, beginnin' with yewrself.

Citrus Fruit Market

LOS ANGELES, May 17, 1911.—With Navels running largely to over sizes, also becoming a little bit soft and some of them not arriving in market in the best of condition, there is a very slight easing of the orange market. The better grades and firmer fruit, however, are practically up to the quotations of last week. Valencias are being forwarded from some sections and the fine quality is commanding top quotations. Another week, or possibly two, will see Navels and all others excepting Valencias, cleaned up at this end, although those in transit and cold storage will keep them in the markets for a few weeks.

The quantity of foreign lemons afloat is much smaller than usual and Californias are being well received in all markets; prices if anything are rather better and will continue improving as the weather warms.

Shipments of oranges to date since November 1st, 1910: 26,437 cars; lemons 3385; total 29,772. To same date last season: Oranges 18,173, lemons 2450; total 20,623.

LOS ANGELES, Wednesday May 10.—Six cars of oranges were sold here today.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Cough.

Kindly send me a good cough remedy for horses.—Subscriber, Arroyo Grande.

Mix chlorate of potash 2 ounces, powdered belladonna 1 ounce, powdered nux vomica 2 ounces, and powdered fenugreek 10 ounces, and give one tablesponful twice daily in the feed. Also give one tablespoonful of Fowler's solution in the feed with each dose of the powders.—F. G. M.

Garget.

A Jersey heifer, which I have been milking eight months, has been giving stringy milk containing bloody specks the past six weeks. Please state cause and remedy.—Subscriber, Stockton.

This is a form of garget. Use Iodin Petrogen as a local application twice daily over the affected quarter of the udder, and rub gently but thoroughly. Give the cow one tablespoonful of hyposulphite of soda morning and evening in the feed.—F. G. M.

Teats' Orifice Contracted.

I have a cow four years old and with her third calf, in the pink of condition. We must be careful to strip her instead of milking in the ordinary way, as it seems to hurt her and she kicks. The openings of the teats seem to be closed. Could teat plugs be used to stretch the openings?—Subscriber, San Diego.

Teat plugs are indicated. Inserting the plug may be painful, hence it would be well to secure the hind limbs, one to the other, with a strap or in some other way, to prevent kicking, and thus protect yourself and avoid soiling the teats during the manipulations. Sterilize the plugs in boiling water and cleanse the teat thoroughly with an antiseptic solution before using the plugs.—F. G. M.

TULARE GRANGE.

(Continued from Page 613.)

stimulating to industry and thrift is a blessing.

Sister Ella Stiles read an interesting paper on "My Summer Vacation." It is best enjoyed in the woods, at the ocean, in the open, in touch with nature, nature's works and nature's creations. It leads us to better thoughts and a better life, gives us better health, and leads us to think more and better of our friends and to carry those thoughts through life.

The Grange being informed that Mrs. M. E. Sherman was in a sanitarium in San Francisco, the secretary was directed to send her the kind sympathy of the Grange and our earnest wishes for her safe and speedy recovery.

The Grange was informed that Sister Fay, an octogenarian and past chaplain of Tulare Grange, had suffered a stroke of paralysis, but is improving. The sympathy and best wishes of the Grange were sent to her.

At each meeting a plain but appetizing lunch is served, during which an hour of enjoyable social intercouse is indulged in.

LANDSCAPE GARDENING.

(Continued from Page 619.)

than grow plants for the money we may save or gain by them. It does not matter whether we have in mind a great park or a small city square, a large estate or a modest dooryard, we must go about our work in an artistic spirit if we want a good result. Two trees and six shrubs, a scrap of lawn and a dozen flowering plants, may form either a beautiful little picture or a huddled disarray of forms and colors."

Business

A HANDY GRINDER.

One of the neatest, most serviceable and convenient grinders we have ever seen was last week shown us by the Coulson Poultry and Stock Food Company, of Petaluma. It is a small affair, weighing, we should judge, about thirty pounds, and has adjustable burrs which can be set for fine or coarse grinding. It can be fastened to a table, bench or any flat surface and is ready for use at all times.

The machine grinds oats, barley, rye, corn, peas, dry bone, shells, etc. The low price of five dollars should place this convenient grinder on hundreds of California farms.

CHANGED NAME.

The Braun Chemical Company, one of the largest of its kind on the Coast and which for several years has supplied farmers with fertilizers and chemicals used in agriculture, has decided to change its name to the California Drug and Chemical Company. The reason for the change is to avoid confusion consequent upon the various Braun interests in this state. Of course there will be no change in management or in the handling of this immense business. Cultivator readers will still be able to secure the best of treatment.

The Clarchen Packing Co. of Los Gatos writes the Nitrate Agencies Co. that a dry field of oats which produced 1½ tons of hay per acre in 1909 was made to yield six (6) tons per acre the next year by applying 200 lbs. Nitrate of Soda per acre. It is thus seen that even on cheap crops it pays to use Nitrate of Soda.

Coulson's
MADE IN PETALUMA

Special chick food

If nature hatches the egg, you should save the chick. And you can do it with Coulson's Special Chick Food—the greatest life-saver known in the chicken industry.

This food is the result of years of study to get just the right ingredients in a proper mixture to save the largest possible number out of every 100 chicks.

Coulson's Special Chick Food is an investment, not an expense. It pays big dividends by starting chicks on the road to profit for you. Costs about one cent a chick for four weeks' feeding.

Coulson's Growing Chick Food must be used after the first six weeks, to keep up the steady growth of the chicks up to three months, at which time they are old enough to use Coulson's Egg Food—the standard feed for laying hens.

At your dealer's or from us. Write for the interesting book, "Poultry Feeding for Profit." It's free.

Mr. Land Buyer:

If buying agricultural lands to use, you are taking great chances buying without a chemical analysis.

If buying to sell, an expert's report will help you to sell in half the time at a higher price; since if not found good, he will be able to advise a means of improvement, and if good, your land is sold.

Plowing and Threshing Machinery Exclusively

It Doesn't Cost Any More but It Will Earn You More

"Beats 'Em All for Making Money"

"I have run..... and many other machines, but the **Wolverine** beats them all for making money. I have put 216 pounds of dry straw in a bale and 175 pounds of hay." (Abstract from letter received. Name and address of party furnished on request.)

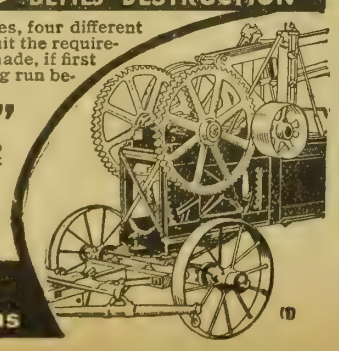
From "stem to stern" the **Wolverine Hay Press** is RIGHT. There isn't a dishonest or careless spot in its whole make-up. We have the biggest plant in the country devoted exclusively to making Hay Presses. The **Wolverine** has made an enviable reputation—and it is maintaining that reputation and increasing its facilities every year to take care of the growing demand.

A smooth, even, heavy bale comes from the **Wolverine Hay Press.** It is a fact that dealers will often pay more for hay put up in nice bales. It eats hay as fast as it can be handled by four men in a mow. It can be depended upon to work every hour in the day without a repair man constantly "tinkering" around. It is built for hard, long service.

Wolverine Hay Press

WOLVERINE CONSTRUCTION DEFIES DESTRUCTION

The Wolverine is built both with steel and wood frames, four different sizes, all with double gears, with various equipments to suit the requirements of purchasers. It isn't the cheapest Hay Press made, if first cost is considered, but it is the **cheapest baler** in the long run because there is an absence of repair bills.



Write FOR THE "Wolverine Book"

Every farmer will find many interesting and instructive things in the "Wolverine Book." A postal will bring this book to you. It's worth asking for.

Tree Troubles--- Their Causes

The Relation of Climatic and Soil Conditions to Cases of So-Called Mottled Leaf, Withertip, Dieback, Little Leaf, Etc.

By Prof. Ralph E. Smith,
Southern California Pathological Laboratory

THE PAST winter and spring have been marked by a prevalence of fruit tree troubles of the general nature of dieback, yellow or mottled leaf, failure to start into growth in the spring, weak, yellow, sickly growth, failure of fruit production, death of buds and similar phenomena. The most prominent and important of these troubles have been the "Mottled Leaf" and "Dieback" of the orange in certain portions of Southern California, the so-called "Little Leaf" of the peach in the San Joaquin Valley and the "Yellows" or "Dieback" of the walnut in the southern part of the state. Various causes have been ascribed to these troubles and the present article by no means aspires to settle the cause of these obscure troubles at one swoop. Certain observations, however, made in various, widely separated localities, are extremely suggestive at this time.

The Dry Year of 1910.

We would first call attention to the fact that the calendar year 1910 was one of the dryest on record in Southern California and in the San Joaquin Valley, the rainfall for the year in these sections averaging only from four to five inches. An almost equal amount fell in December, 1909, and again in January, 1911, but from January 1, 1910, to January 1, 1911, there was practically no heavy, well-sustained precipitation. The result of this was that the soil dried out unusually early in the spring of 1910 and by the time rain came again in January, 1911, unirrigated land was extremely dry and to an unusual depth, while irrigated soil, unless given an unusually large amount of water from early spring to late fall, was in the same condition. In the majority of our irrigated orchards the owners expect to use more or less water during the summer, which application is supposed to be supplemented by copious rainfall during the winter months. Such rainfall is expected to soak the ground more completely and deeply than can ordinarily be accomplished by irrigation and is counted upon particularly to create a subterranean store of moisture in the subsoil. The citrus grower expects, in an average season, sufficient rainfall to make all irrigation unnecessary during a period extending from about November first to May first. Relying upon such an expectation his inclination is to withhold irrigation after October, waiting for the expected rain, and to put it off as late as possible in the spring for the same reason. The grower of deciduous fruits, whose crop comes off in the summer or early fall and whose trees are leafless and dormant during the winter, stops irrigating still earlier and is apt to pay little attention to his trees after the crop is gathered.

Most seasons this confidence in the elements is not misplaced, rain coming soon enough and late enough to prevent serious damage. But when a dry fall follows a dry spring, making a whole year with very little rain, trouble is likely to occur. In such a season, even with more irrigation than usual, the soil does not get the deep soaking which only long, heavy rains can give it, and the subsoil is likely to dry out. This condition is most pronounced, naturally, on soils underlaid with a porous subsoil not having the greatest water retaining capacity, or where there is hardpan or other hard material beneath the surface, preventing a deep soaking in of the water. The average irrigation comes far from equalling a good rain in wetting the ground. When the winter rain is up to the average in amount and distributed over its normal season, orchards which receive even tolerable irrigation, upon soils of even moderate water retaining capacity, may go through in fairly good condition, but after a season like 1910 unusual effects and conditions are to be expected.

Mottled Leaf of Citrus Trees.

Affected trees show a yellowing of the leaves between the veins, with the green color only along the mid rib and the lateral veins, giving the leaf a mottled appearance. Examination shows that leaves once green never become typically mottled thereafter, although they may become lighter in color, or even bright yellow. Typical mottled leaves are found only towards the ends of the shoots, and represent leaves in which the green color has never completely developed, rather than those in which the chlorophyll has once existed but then disappeared. Mottled leaf is a case of non-development or slow development of chlorophyll. Along with the mottling of the leaves there also occurs, if the trees are badly affected, a decided shortage in the amount of fruit, and in typically bad cases the fruit present is of very small size, becoming fully colored when only an inch or two in diameter. Considerable dieback also occurs, and the foliage is thin and weak, giving the tree a brushy look, with many small, dead twigs at the extremities.

Mottled leaf is by no means to be always regarded as a symptom of disease or a cause for alarm. Frequently in the winter, young, rapid growing trees or shoots show such a condition in their youngest leaves, especially during periods of long continued cold rain. This is to be regarded as simply a temporary setback in the development of the leaves, and with warm

(Continued on Page 648.)

Withertip and Its Treatment

A Discussion of a Most Perplexing Trouble and Easy Method of Control. Used by Courtesy Pomona Journal of Economic Botany.

Written by E. O. Essig,
Horticultural Commissioner, Ventura County

FROM OUR knowledge of this disease it appears to be increasing, and we are probably justified in predicting that it has not yet reached its worst. The disease is in all likelihood an introduced one, and it may be looked to to attack the sweet orange in addition to the lemon, lime and pomelo.

History and Distribution.

The fact that the wither-tip had existed as a serious citrus pest in other places first led progressive growers to fear it in this country. At the present time it is known in practically every citrus-growing section in the world, in spite of the fact that many hold that it can do damage only where certain moisture conditions are secured.

In California.

In this state the disease may be found in practically every citrus-growing section, but it is not contended that it has been doing damage in all.

Description.

The presence of the fungus is best told by its appearance on the leaves. The most common forms are leaf-spots which show up while the leaves are still clinging to the tree and appear to be healthy in every other way. The spot is usually light brown to nearly colorless and is surrounded by a very characteristic brown ring, which separates the dead from the living tissues of the leaf. Arising from the dead discolored spot are numerous minute dark acervuli (fruiting bodies of the fungus). The spots may begin at any point of infection and spread so as to run into each other, almost entirely destroying the texture of the leaf. They may start at the tip-end or at an edge and cut out deep margins. It appears that this condition is brought about by the fact that after the infection started the leaf was able to retain enough vigor to resist the attacks, so that the diseased areas only were killed, instead of the entire leaf succumbing and falling off as is usually the case.

This latter form is perhaps the most common indication of wither-tip on the lemon trees. The leaves first turn a sickly yellow color, gradually become brown and fall to the ground. Many may fall while still in the yellow state, while large numbers have been collected and the withertip obtained from them, which were still green when they fell. Not a few leaves may be found which begin to turn brown at the tip, the infection working backwards to cover the entire surface before the stem is reached and severed.

On the sweet and navel orange trees the infestation is very marked and sudden. The leaves die, curl up and turn a greenish-brown color while still hanging to the twigs. Entire twigs may thus be affected, and the foliage does not fall until it is thoroughly dead and dry. One can always tell this stage by the dark color of the leaves.

On the Twigs.

The twigs on the Havana Sweet orange trees at Santa Paula often died as far back as did the leaves, but in most cases they first remain green but bare for some time after the leaves have been killed and dropped.

The twigs of the lemon trees do not succumb to the attacks of the disease as rapidly as do those of the orange. They remain bare for a long period, and though green and healthy-looking, do not bear leaves or fruit. So far as worth to the tree is concerned, they might just as well be dead. In time they do turn brown and slowly die from the tips back.

On the Fruit.

The fruit spot, commonly called lemon spot, orange spot, and pomelo spot or anthracnose, is the most easily recognized. On the lemon it usually develops in the packing house, and is first simply a dull green blotch, remaining so after the lemon has turned yellow in curing. Later the center of the spot, which may enlarge, becomes from a sickly yellow to a brown color, and is softer at the margins, which have retained the same firmness as the rest of the lemon. This stage develops the black or dark brown acervuli, which appear in the center of the spot, giving it a dark color. The tissues begin to sink, forming a depression in the center of the spot. The fruit may keep in good condition when thus infected for a long time without any apparent progress in the work of the fungus, and again it may decay very rapidly. The green spot may not develop to form the fruiting stage until after the lemons have been placed upon the market, so may admit of the marketing of the fruit, but it places it in the lowest grade.

It will be interesting to note that many have considered this spot a result of sweating, and not a fungus at all, but it is the withertip brought out, perhaps, in greater abundance by sweating than under normal conditions, which has given rise to this belief.

On the orange the first symptoms appear as greenish or brownish irregular blotches, resembling greatly those described on the lemon. These spots grow rapidly while the fruit is still on the tree, and may assume nearly half the size of the fruit.

It is the dropping of the young fruit that is considered the most serious work of the fungus in the lemon orchards. At times it seems as if a

third of the young setting lemons were dropped by it. The brown mummies on the ground or still clinging to the leaves are full of the wither-tip spores.

The first sign that we notice in connection with the wither-tip dropping of bloom is that a great number of unopened flower-buds have fallen from the tree. As this effect may be the result of other causes, the mere fact that we find unopened flower-buds on the ground should not be considered as proving that we have a case of wither-tip bloom dropping. Upon closer examination, however, we find that where the bloom has dropped on account of being affected with the wither-tip fungus there are little red markings upon it; and the buds or blossoms may be partially, or even entirely, covered by these red patches.

When much bloom has dropped as a result of being affected with the wither-tip fungus, one almost invariably finds the typical signs of wither-tip on the tree. The most prominent of these are the dying back of small sprigs, and the very characteristic want of leaves on the inside of the tree. Whenever one sees a tree in the orchard that has no interior foliage, it should be noted as a suspicious specimen.

Fig. 2. Spots caused by withertip on lemon; the same on orange

Conditions Favorable to Growth.

Any climatic condition unfavorable to the growth of the tree is liable to bring on an attack of wither-tip, especially in a country which has been subject to this attack.

Frosts kill the twigs of the trees and afford excellent places for the fungus to germinate and produce spores.

Hard winds whip the trees so as to cause numerous abrasions and wounds, which afford excellent entrances to the spores of the wither-tip.

Perhaps no better condition is afforded for the infection of the plant

The Orange County Dried Fruit Association will handle from one-third to one-half the crop of dried apricots produced in that county.

tissues than that due to the attacks of insects. Scale pests constantly draw sap from the trees, and the slightest rain washes the spores down the limbs and into their punctures. It might be expected that this disease would be worse in dirty orchards than in those which are kept perfectly clean.

Gummosis has certainly had something to do with the production of the "red spot" so often referred to. As has been stated, the two conditions have been associated together as arising from a common cause. The spot is probably caused by the weakening of the tree due to the gummosis rather than any other reason. It might naturally be expected to find the withertip upon any diseased trees which are suffering from gummosis, die-back, foot-rot, etc.

Poorly fed trees have been observed to succumb to this disease first—the leaves showing the spots, the twigs dying, and the fruit spotted before it appeared elsewhere. The cure is obvious.

This is perhaps the most important factor in contributing to the growth of this disease. As with all of the fungi, a moist condition produces ready and rapid germination and excellent conditions for future growth. The early observations of the withertip were all connected with the belief that it could thrive only in a very moist climate. This belief caused some surprise to the Florida experts, who thought that the climate in California was too dry.

The attack in Ventura County was preceded by an unusually heavy rain, which brought on the attack almost immediately.

Modes of Distribution.

The spores are so minute that when they become dry they may be carried for miles by the wind. These spores are usually blown into the tops of the trees, and the heavier attacks may be expected in these places. In Southern California it must be expected that, if the disease is common along the coast, the coast winds are sure to carry the spores to all inland sections, and these need only the moisture conditions to produce the disease.

If the spores find lodgment in the tops of the trees they are sure to be carried to all parts of the undergrowth by the first rain. This is the most effectual way of infecting all parts of the tree. The "tear-stain" is produced by the dripping of the water from an infected twig or "mummy" to an uninfected lemon.

Insects.

Prof. Rolfs attributed much of the redspot to the work of the red spider, and this indeed is a very important factor in scattering the spores on the leaves and fruit as well as a means of inoculating those portions of the tree. Other insects, as young black scale, plant lice, as well as the silver mite, prove efficient distributors of this disease.

Methods for Control.

The methods used in the control of this fungous parasite must necessarily be preventive. After the disease is once established in the tissues of the host it can never be destroyed without first destroying the host also, because it works within the tissues, and until the acervuli appear upon the surface to expose its conidia or spores for distribution, it is protected by the epidermal layers of the host.

Many methods have been recommended. It may be that certain measures taken in some localities may prove impractical in others, while a combination of all may be successful in special cases.

Spraying.

In all the work that has been done with sprays in combating the withertip, the Bordeaux mixture stands out as the most efficient, and we are wont to give it the first place in this consideration.

The formula now used at the Limoneira orchard is known as the 4-4-50 or

ons outright, and it was difficlut to ascertain just which wood was infected, the matter of pruning has never been taken up. Then, too, the disease was so general that the possibilities of eradication or control seemed hopeless by means of so slow a method.

How to Prune.

The important thing in pruning is to cut out enough of the wood in order to get rid, not only of the bare branches, but also of all the branches that show even a slight sign of the disease. In severe cases of wither-tip there are seen, in addition to bare branches, many limbs on which the yellow leaves are about to fall. Close examination will show that the disease is slowly making its way back and poisoning these limbs. This poisoning may start from an infection at the tip, or from an infection on a side branch lower down, from which the poisonous effect has spread to the main limb. Sometimes only one side of a tree, or only one branch, is severely affected, while the remaining part of the tree is uninjured. Whatever may be the conditions, it is important to get rid of these poisoned limbs. All limbs that show the beginnings of the disease must be taken out. Drastic measures must be employed, and many bearing limbs may have to be sacrificed. To prune only half-heartedly may make matters worse, rather than better. When pruning, care should be taken to make smooth cuts, usually at the base of a branch or limb, so as not to leave any projecting stubs, in which infection is almost sure to start again. After pruning, paint the larger cut surfaces with carbolineum or pine tar.

The grove should be given unusual care after a severe pruning of this kind. It should be fertilized, so as to bring about a vigorous, healthy growth, and to render the trees resistant to further attacks of the fungus.

When to Prune.

Winter pruning for wither-tip should be done between the middle of December and the middle of January. It is important not to delay the work beyond this date. Do not prune while the new growth is putting out, for this is almost sure to result in injury rather than benefit.

Orchard Practice.

It has been made very plain by all authorities that a weakened condition in an orchard under certain conditions is liable to bring on an attack of wither-tip. That this is true cannot be doubted.

Every possible means should be exercised to keep the orchard in excellent physical condition. As cultivation is a very important factor in this work, it should receive its full quota of attention. In groves subject to this disease the soil should be stirred deeply enough and often enough to insure all that is demanded from it by the tree.

A starved condition of the tree cannot be brought about more effectually than to cut off the water supply. Thus such a condition favors the attacks of the disease. It is not necessary to warn watchful growers against this state of affairs, for it is a condition not desirable in any grove.

Fertilization.

The lack of fertilizers might cut off the food supply and have a tendency to bring on wither-tip, but it is not in this regard that I wish to call attention to this point. It is what Prof. Rolfs has to say in this regard: "In choosing fertilizers to aid in warding off these diseases (various stages and phases of wither-tip) a large percentage of potash should be used in the compound. The source of potash does not seem to be important, but sulphate of potash has proven a general favorite among growers of citrus fruits.

"Sulphate of ammonia is somewhat slower in acting than nitrate of soda, but gives a firmer leaf. Nitrate of soda will produce a very quick growth and a large leaf, but these are especially subject to the attack from the fungus unless well balanced by a generous supply of potash. Organic ammonia in the form of dried blood, cotton-seed meal and bone meal should not be used in combating this trouble, as it is very likely to produce die-back in addition to the softening of the wood, and so lay the tree doubly open to attack."

Fig. 4. Above a characteristic leaf spot of lemon, probably also due to withertip; below fully developed acervuli of withertip on orange twigs.

Deciduous Fruit Culture

CONTROL OF THE BLACK PEACH APHID.

(Aphis persicae-niger Smith.)

By E. O. Essig.

Nursery Stock.

The first and most important measure in dealing with this pest is to see that the young trees from the nurseries are free from the pest at the time of setting them out in orchard form. This can be brought about by the proper treating of the young trees in tobacco extract or by fumigation with carbon bisulphide or hydrocyanic acid gas. Care should be taken to see that all peach trees from eastern and middle western states are so treated before allowed to enter this state or any county therein.

In the Orchard.

After the pest is once introduced as in the case of many localities in California, the methods of control must be thoroughly understood and carried out to secure good results. That the insect can be controlled is the experience of a great many scientific men, without any very great cost and no injury to the trees. To dig out trees for this pest is like digging out our orange trees for black scale, an act of pure folly. The task is, indeed, not a small one and must be pushed throughout the entire year. Winter and summer treatment may be necessary, though where the former is rightly done there may be no need of the latter. Methods of control, then, must fall under two heads as follows:

Winter Control.

Due to the fact that this insect passes part of its existence upon the roots of the trees, it is somewhat difficult to handle. It is usually during the winter months that it will be found underground. In the winter treatment, then, it is necessary to effect some measures for destroying these underground root forms which come to the top early in the spring and attack the first young buds. In handling the root forms two types of remedies have proven very useful, viz., preventives and insecticides.

Preventives: It has been found that the application of certain minerals, which benefit or do not hurt the tree, have done much toward making peach trees immune to the attacks of the black peach aphis. Those so used are as follows:

Manure. Heavy applications of stable manure around the base of the trees before the first winter rains have driven away the root forms and prevented the appearance of the spring broods.

Kainit. This compound has been successful as a preventive for various underground insects and will give good results here. Dig away some of the surface dirt around the base of the tree and apply a good dressing to a considerable distance from the tree so as to insure a quantity of the dissolved mineral salts reaching all of the lateral infested roots. The insect usually works just below the crown and an application near the trunk may be all that is found necessary.

Gas-lime. This has also some value as a preventive, as nas wood ashes in large quantities, though the latter may not benefit the health of the tree.

Insecticides. These contact solutions, seeping through the soil and coming in contact with the soft-bodied insects, work the same as a spray on the forms above ground, and are:

Tobacco Decoction—
Tobacco stems or waste..... 1 lb.
Water ..... 6 lb.
Soft soap ..... 1 lb.

Liver of Sulphur—
Potassium Sulphide ..... 1 oz.
Warm water ..... 1 gal.

Carbolic Acid Emulsion—
Crude Carbolic Acid..... 1 gal.
Whale Oil Soap..... 8 lbs.
Water (hot to mix)..... 8 gals.

Dilute one part to 20 parts of water before application.

Applications. In applying all of above the nature of the soil must be taken into consideration. If the soil is sandy and allows a free passage of the liquids it will take several gallons, poured around the trunk, to insure a good killing, but with only one or two applications during the winter, while a heavy soil will not admit so much at a time, but will require more applications. The soil should be removed around the base so as to expose the crown roots and the liquid poured in, but not allowed to stand for any length of time in contact with the base.

Carbon Bisulphide. In light, sandy soils this may be used very effectually upon the root forms. Make deep holes around the trunk of the tree and pour in each a small quantity (2 tablespoonfuls) of the liquid, promptly covering up the hole to prevent the escape of the gas.

Spring or Summer Control.

As soon as the aphids begin to appear upon the small limbs and buds is the time to begin spraying. The first broods in the spring are all wingless. In April and May winged specimens begin to appear and these spread rapidly. The point is to kill the first broods before these winged individuals appear. Careful watch should be made of the trees individually and as soon as any insects are found spray with one of the following before the blossoms open:

Kerosene Emulsion—
Kerosene ..... 2 gals.
Whale Oil Soap..... ½ lb.
Water ..... 1 gal.
For use dilute 1 to 20 of water.

Whale Oil Soap Spray—
Whale Oil Soap..... 1 lb.
Water ..... 6 gals.

Tobacco Decoction—
Tobacco refuse ..... 1 lb.
Water ..... 6 gals.
Soft or Whale Oil Soap..... 1 lb.

"Black Leaf" (Tobacco Extract)—
Black Leaf ..... 1 gal.
Water .....60 gals.
Carbolic Acid Emulsion (see above).

Application—In small orchards it is necessary to use a hand pump and very good results may be obtained if care is taken to make the application thorough. Use as much force as possible and do not be stingy with the liquid. A power pump should be used if available and a pressure of from 150 pounds to 200 pounds maintained.

Conclusions.

1. Be sure that you have the Black Peach Aphis before applying underground methods. The adult insects are always black, while the young are reddish-yellow or amber. The adult wingless forms are deep shiny black and highly polished.
2. If you are sure that your peach trees are affected, treat in winter as directed.
3. Spray in early spring before blossoms appear.
4. Repeat in summer if necessary. It may be that the lice are kept down by natural insect enemies and no further work need be necessary.
5. Intelligent work will always handle this insect, and it is never necessary to dig out trees in a generally infested district.

Wagon Wisdom

It's wagon wisdom that prompts a farmer to select a Weber Wagon. He knows that the 61 years experience in wagon building which stands behind every wagon is a guarantee that when he buys a Weber he buys the highest quality. Sixty-one years of wagon building have resulted in the Weber wagon of today, which, for correct design, excellence of material and conscientious construction, stands without a peer — King of all farm wagons.

Killefer Riding and Walking
BEET PLOWS

Killefer Walking Beet Plow

This is the strongest plow on the market. Can be had with straight or offset standard, and has one piece land side. Nothing but hard plow steel is used in the Standard Shin Landside and point. Point and Shin are reversible. We guarantee this plow to do satisfactory work in any beet section.

Two Row Riding Beet Plow

It is especially adapted to large acreage, as it does double the work of single plows with but little more draft, and leaves the ground in fine condition for hauling off beets, as it does not throw up large clods.

The Standard Shin Landside Point and wings are made of very hard steel, which we have rolled for this work, and extras are always on hand for immediate shipment.

Both plows can be had with or without steering device. Write or call on us direct if your dealer does not have these tools.

Killefer Mfg. Co.
2210 Santa Fe Avenue
Los Angeles, Cal.

Tell us your troubles. We make special tools to order for handling special work.

Five Thousand Eureka Lemon Trees

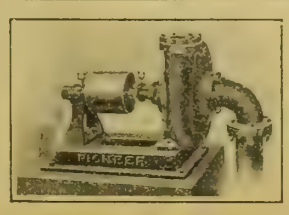
To be delivered in May, 1912, balled f. o. b. on cars Whittier, 55 cents each. Also one thousand 2 year old Navel trees for immediate delivery.
Address 209 So. Greenleaf Ave.
Whittier, California.



Why Experiment with Inferior Pumps?
Buy a pump built on the Pacific Coast, and adapted to your needs.
Our pumps have been in use and on the market for years, and have stood the test of time.
Buy direct and save freight and jobbers' profits. Live, erecting agents wanted. Our retail prices are less than our competitors' wholesale prices.
PEERLESS IRON WORKS
125-127 O St. Sacramento, Cal.

In acreage

"Twenty's Plenty—
Forty's a Fortune"

A good stand of alfalfa a year old will support from 10 to 20 hogs on an acre throughout the year on one of our small farms in the Sacramento Valley.

That Hog

THAT HOG was a little suckling pig one year ago. To-day he weighs from 200 to 250 pounds and will sell for from 6 to 8 cents a pound, live weight. A good stand of alfalfa a year old on one of our small farms in the Sacramento Valley will support from 10 to 20 of these hogs to the acre throughout the year. Figure out the possibilities of 20 to 40 acres of alfalfa one year old stocked with hogs.

You can purchase one of these small farms from the SACRAMENTO VALLEY IRRIGATION CO. on very liberal terms—

$15 DOWN THAT'S ALL **$11 A YEAR** THAT'S EASY

They will sell you from 20 to 80 acres at $125 an acre. Pay $15 an acre down and the balance spread over 10 years. Write to-day for full information.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

LARGE LUNG CAPACITY IN COWS.

A cow, to be a good one, must have large lung capacity, but in order to produce well she must be supplied with a sufficiency of pure air, else this is of no advantage to her.

A case to illustrate this is given herewith: I was testing two cows at home for over a month; one gave more milk and butterfat than the other right along. They both had the same air supply, standing side by side, but one was able to use much more than the other as her general conformation showed she was a cow of large lung capacity. The same two cows were brought down to Guelph, Ont., in a dairy test; both were equal in heartiness and feeding well, but at this time the cow that had always produced the heaviest did not produce any more than the other.

The reason, I consider, is that the stable where the dairy cows were kept at Guelph was so constructed that pure air could not be supplied to the cow at her head without reducing the temperature of the stable too much. The ceiling was too high for one thing, then the cows were tied up against a solid wall and their breath had not a chance to get away from them, and they had to breathe much of the same air over and over again. A cow taking too much impure air into her lungs is injured rather than benefited. The way many stalls are built a cow should breathe through her tail, as the air has a better chance to circulate behind.

Men who have done much testing know that heavy milk cows are greatly affected by hot weather in the summer. I was testing a four-year-old the latter part of June, 1907. She was making 2.5 lbs. of butterfat a day. A very hot spell came on, she went down to 1.85 lbs. per day, due to nothing, I am sure, but the heat. This is only one instance of many that go to show the same thing. In this case the cow was using her lungs to the best advantage when the weather was cool, but taking into her lungs so much air that was necessarily hot, it, with heat from the food she consumed (and it was only grass) made her too hot. It is just as detrimental for a cow to go to the other extreme and have it too cold. With pure air, not too cold nor yet too hot, a cow does her best. The oxygen derived from the pure air goes to the nerve centers, producing in her energy necessary for heavy production.—Coleman's Rural.

BREEDING PRINCIPLES.

B. W. Hunt of Eaton, Ga., was one of the most successful breeders of Jerseys in the South. He was not a mere mater of male and female, a blind devotee of pedigree, but he saught to look deeper into the problem. Here are a few of his ideas:

"I never bred for pedigree without performance—never bred for beauty—never bred for color of hair—but always with the idea of producing animals that would yield the utmost salable product and bring up the farm's net income to the highest."

Then again:

"My observation years ago led me not to value the son or the daughter of a phenomenal cow or race more. What a breeder should prize above all things is a high average of excellence extending as far back as the pedigree records."

There is no doubt of the soundness of Mr. Hunt's ideas. The principal difficulty, however, is that pedigree records extend much farther back than do records of performance.

But the true breeder is one who breeds for a high herd average, not a few cows of phenomenal performance. His idea of not placing value on the son or daughter of a phenomenal cow is in accord with our own observation. Some of the sorest disappointments that have come to men have been right in this line. They have paid high figures for such sons and daughters only to find that the cow in making her phenomenal record had nothing left to endow her progeny. The cow cannot burn the candle at both ends.

Prepotency, that most valuable thing in a sire, simply means a surplus of stored-up heredity in a given direction. Much safer would it be to hunt around and find the first and second calf of the phenomenal cow to which she gave birth before she had exhausted her vitality.

In our own herd, the bull Espanore 2nd was the son of the grand old cow, Custer's Belle. His prepotency was such that he has seven daughters in the Advanced Registry. None of her subsequent sons proved as prepotent sires of cows. How illy that accords with the quite general notion that the first calf of a heifer is not as prepotent as those born at more mature age.

High breeding and moderate feeding, with easy, not forced, records, should be the motto with all breeders. An Advanced Registry obtained in that manner bespeaks the natural virility of the cow with an abundance left for her calf.—Hoard's Dairyman.

ZEBRA HYBRIDS.

When Negus Menelik, of Abyssinia, presented two fine Grevy zebras to ex-President Roosevelt, he regarded them as ornamental creatures that would make an interesting addition to the Zoological Gardens in Washington. But the ex-president saw in them the possible solution of the beast-of-burden problem that has so retarded the development of Africa.

Eighty per cent of the oxen imported into East Africa die within the first six months, horses cannot stand the climate, donkeys are too small and too slow, zebras won't work, and African elephants, since the days of Hannibal, have never been trained to make themselves useful.

If the strength of the zebra and the working qualities of the donkey could be combined in one creature, the greatest obstacle to the development of the country would be overcome. The zebras were given into the keeping of the Bureau of Animal Industry to experiment with as they would.

Breeding the zebras to mares has as yet been unsuccessful, no living progeny being produced. With jennets the experiments have succeeded better, and the bureau now has eight young zebrasses. Of the various important breeding experiments with draft animals, few are as interesting and encouraging, at the present time, as these experiments.

Three of the zebrasses are now two years old, and have been broken to drive single and double. One of them has been broken to the saddle. Their conformation and action leave little to be desired, and they promise to have great industrial value. Unlike their sires, the hybrids have good dispositions, and little difficulty was experienced in breaking them.

Zebra-hybrid breeding is still in the experimental stage, and no one can foretell its future. But indications point to its one day becoming a great industry in our Southwest. Climate and soil there are admirably suited to zebra raising. If the hybrids fulfil their present promise, the demand for them will be something enormous. It will be years, at least, before the African call for beasts of burden can begin to be supplied, and it is more than likely that the demand will be echoed within the borders of our own country before we have any for export.—Eugene Smith, in Farm and Fireside.

A horse accustomed to hard work and good feed should not be so heavily fed during a rest,—probably no grain at all, or at least a very small quantity, should be given on Sundays and other rest days.

Irregularity in time of feeding and quantity will cause indigestion.

CHAMPION AYRSHIRE COW.

Netherhall Brownie 9th 23985. Official record for 365 consecutive days, 18,110 pounds of milk and 820.91 pounds of butter fat, equal to 958 pounds of butter.

It gives me great pleasure to announce the completion of the year's test for admission to the Advanced Register of the above cow. She was tested under the supervision of the Washington State Agricultural College, and has given the largest official record both in milk and butter fat of any Ayrshire cow in the world, so far as heard from. This record places her above the cow Rena Ross, who has held the world's championship for the Ayrshire with the official record of 15,072 pounds of milk, 751 pounds of butter.

As an indication of progress in Ayrshire breeding, and as exemplifying the value of advanced registry testing, I would say that the first Ayrshire cow to stand as the world's champion Ayrshire cow was Rena Myrtle, with a record of 12,172 lbs. of milk and 546 lbs. of butter, tested by the Vermont Experiment Station.

This record she held for a number of years, until the Association inaugurated the Advanced Registry System of testing, which brought to the front the Ayrshire cow Keepseke, with a record of 12,365 lbs. of milk and 548 lbs. of butter, making her the world's champion Ayrshire cow, which she held until Rena Ross came along with a record of 15,072 lbs. of milk and 751 lbs. of butter, and now Netherhall Brownie 9th goes ahead with a record of 18,110 lbs. of milk and 958 lbs. of butter.

All this shows what we have always claimed, that there are Ayrshire cows kept in obscurity, that would astonish the world if the owners would only give them an official test, and we believe the above is only the beginning of a far more abundant harvest, and that the 20,000 lbs. milk and 1000 lbs. butter yield is not far distant.—C. M. Winslow.

WARBLES.

If you will examine your milch cows at this time of the year, you will likely find some lumps or protuberances on the sides and along the back. When your cattle are out on a warm day, they will be racing around the yard or rubbing themselves against posts. These protuberances are warbles. We are not going to tell you how they got in there. You would not believe us if we did; and we have wasted so much time trying to make you believe it that we are not going to waste any more.

The thing for you to do is to get rid of those warbles. You will find them on the poorest cattle, although we have seen them on steers nearly ready for market. The warbles are not on the cattle because they are poor; but the cattle are poor because they have warbles.

How to get rid of them? Well, if there are not too many, the easiest way is to take your thumbs and press on each side close up until they pop out, and then put your foot on them. You will find over each warble a minute hole in the skin, through which it receives air. Fill up that hole with any thick oil, and thus smother the beggar. Some use sheep dip or other poisons.

We are not particular about the method used, just so you get rid of them. If you do not, you will have warbles next year in all your cattle. You cannot afford to feed even forty-cent corn to a lot of miserable worms, and that is what you are doing just so long as there are warbles in your cattle.—Wallace's Farmer.

Protein, starch, fat, sugar and fiber are the nutrients that make up foods. Protein is the only one from which muscle and tissue can be made—the others serve to produce heat, energy and fat. Starch and sugar are equal in food value. The fiber in the plant cut green has the same food value as starch—when the plant is mature the fiber becomes largely indigestible as in straw. Fat serves the same purpose in the animal body as starch; it is more concentrated, having two and one-fourth times as much nutriment in a given weight.

LOW BUTTER PRICES Make the Best Separator of Still Greater Importance

There could be no greater mistake on the part of the intelligent dairy farmer than to put off the purchase of a cream separator this year because cream and butter prices are unfortunately lower than they have been for several years past.

Nor could there be any greater mistake than to be tempted to buy an inferior separator at a trifle less first cost on this account.

There may be money in dairying when prices are high with a second or third grade separator or even without any at all.

But when prices are low the use of a De LAVAL separator, with its greater saving and more economical operation than any other, usually marks the dividing line between profit and loss in dairy farming.

There is still money in dairying with a DE LAVAL separator, but the chances are that there is very little without one.

Moreover, you don't have to pay cash down for a DE LAVAL separator, if it may be inconvenient to do so. You can buy one on such liberal terms that it will actually pay for itself from its savings, even at present dairy prices.

With butter prices as they are there never was greater need to buy a DE LAVAL separator, nor stronger reason not to buy an inferior separator or to get along without any.

You need not be in doubt about it. Just arrange with the nearest DE LAVAL agent to see and try a DE LAVAL machine for yourself. Do this if you already have another kind, and try any other kind at the same time if the maker or agent will let you do so.

If there is no De Laval agent near you write us direct for any information you desire, and with the height of the dairy season at hand by all means don't delay prompt action.

Small Fruits and Vegetables

GOOSEBERRY CULTURE.

A north or northeasterly slope is better for gooseberries than a southern slope on account of the advantages of late spring, more moisture and richer, deeper soil. The gooseberry is very partial to a moist, rich, deep soil, prefers a thoroughly enriched, deeply tilled, well drained, strong clay to a light sand loam. However, it will do very well, even on a gravelly, sandy soil. The general tendency is toward light crops on sandy soils, but the reverse is not always true on heavy clay soils. Gooseberries are especially adapted for the intercroppage of young orchards since they will cheerfully submit to partial shade, providing it does not become so dense as to seriously encourage the gooseberry mildew.

In reference to propagation, while the cuttage method of multiplying the named varieties can be used the same as for many other plants, it is not so successful or satisfactory as the layer age method for the gooseberry. Layering is accomplished by two common methods. One consists in bending the lateral shoots down to the ground and covering their tips with moist earth; the other, of mounding the entire plant with earth. The latter is the more simple and more rapid plan for a nurseryman to follow, while the former is probably best adapted for the amateur who desires to secure a few for home use. The work of layering is done any time while the plants are in active growth, but gives better results when done in early spring than early summer. The rooted tips and layer are usually dug in the fall and either stored in a plant room or immediately planted in nursery rows for another year's growth. When planted in the fall they should be mulched to prevent heaving or winter injury.

One-year-old plants from layerage will give better results than either younger or older plants. A well-rooted plant, even though the top is small, is far better than a large top with a poor root. The early ripening of the wood in the summer and the long, leafless or dormant period preceding winter weather, combine in making fall the ideal time to transplant gooseberries. The early shoots and root formation in spring, and the ease with which these are seriously injured, makes late spring planting very unwise. If for some reason early fall planting is impossible, then very early spring is the next best time for planting.

The same special care should be used in transplanting gooseberry plants as is used in the transplanting of larger plants. The roots should be well spread out in a roomy hole, and never crammed down in a slit in the ground made with a spade.

The soil should be firmed about the roots to prevent drying out, and when completed the plant should stand one to two inches deeper than it formerly stood in the nursery.

One of the serious difficulties of most plantations is that they are planted so close together that development of the plant is practically impossible. The square planting plan of 6x6 feet gives very satisfactory results, except where the soil gets very dry during the summer and where the heavy annual rainfall produces an abnormally large wood growth. Under such conditions it is better to plant the rows seven or eight feet apart and still maintain the six-foot space between the plants in the row.

Gooseberries are shallow-rooted plants, but very heavy feeders and so must be treated accordingly. Most of our soils need an abundance of well-rooted nitrogenous material to make them ideal for this class of fruit. Barnyard manure is one of the essentials for successful culture. The shallow-rooting habits of these plants makes deep tillage close to the plants not only impossible, but dangerous, and should never be practiced after the plant has become established. Just as soon as the ground is dry enough in the spring the plantation should be thoroughly worked with a cultivator or disk, tilling as deep as the roots will permit, close to the plants. The subsequent tillage should consist of thoroughly working the surface with a shallow-working tool like an acme, spike-tooth or spring-tooth cultivator every ten days or two weeks until harvest time, and then one or two good cultivations afterwards when the tillage should cease for the season.

A good heavy mulch of rotting straw is a good thing to hold the moisture and keep the soil cool, but attracts field mice and moles so seriously that the station had to dispense with it entirely. As a conserver of moisture, clean tillage or the dust mulch is far superior to the straw mulch system.

If first-class, fine, large berries are desired, the bearing wood of a plant must never be permitted to become old, weak or inactive. The essential thing is to keep the wood vigorous and not permit wood to accumulate in excess of the amount that a plant can thoroughly support. Weak-growing plants and shoots should be severely cut back to compel strong growth.

Since it is impracticable to practice regular fruit thinning gooseberries, a system of thinning when pruning should be practiced. This is accomplished by reducing the number of bearing canes from the large number usually found to from eight to eighteen, depending entirely upon the vigor of the plant. A shoot should not be permitted to bear more than four crops of fruit, after which its place should be taken by a younger, more profitable cane.

The pruning may be done in the summer after the crop is harvested, but our best results have been secured by very early spring pruning, which produced a more vigorous wood growth than summer pruning, and gave better fruiting spurs and wood. Proper pruning does much to simplify picking, and if for no other reason the plants should be thoroughly pruned every year.

A large part of the gooseberry crop is picked while the berries are hard and green, long before they have reached full size, which makes it possible to ship to distant markets in common carriers.

The picking of many American sorts is a tedious, slow, rather unsought task, but the large English sorts, on account of their size and few thorns, are comparatively easy to pick. Like currants, gooseberries should never be picked while wet or hot, since it very materially shortens their lives as a fresh fruit when handled in this manner. While the green fruit will ship long distances, the ripe will not, and must be handled very carefully to avoid heavy loss in marketing.

The common method of marketing gooseberries here in the West is in the 24-quart crate, and while it is a little more expensive than the basket or flat box, yet it places the fruit on the market in first-class shape and nearly always gives better prices than any other method.—Portland Oregonian.

Fine manure in the cow lot may be raked up and applied to the garden between the rows of vegetables during all the summer. It will act as a mulch on the surface soil.

Wood ashes and lime should be sprinkled over the garden and among the growing vegetables often.

ON EITHER SIDE.

They linger at the garden gate—
The moon is bright, the hour is late;
They laugh and talk in accents low,
And so they did an hour ago.
Why do they loiter on the scene?
The garden gate is closed between,
But still they linger, still they wait
On either side the garden gate—
And yet, it cannot be denied,
There's much to say on either side.

The Ornamental Garden

THE ROSE OF SHARON.

There are not many flowering shrubs that have lasted so long in public estimation as the Rose of Sharon. Rose of Sharon is an old name for it, but it goes under these as well: Althaea and Hibiscus syriacus. Why it lasts so many years in universal estimation is undoubtedly owing to its surety of blooming every year, not only blooming, but doing it abundantly. Still another characteristic that enables it to hold its position is that it is a late summer and autumn bloomer, the exact time of its best display depending on the variety it is, for some are earlier flowering than others. Of late years so many new colors have appeared in collections that to get an assortment of two dozen or more distinct sorts is quite easy; and these can be had, too, in both double and single flowered varieties. When one possesses a half dozen or so varieties it is easy to get more by sowing seeds saved in autumn and sown in spring. The flowers mixing one with the other will hybridize, so that much variation from the originals may be looked for in the seedlings; and this is how so many new kinds are obtained.

The Rose of Sharon is in the class of those shrubs that may be pruned back closely every year and to great advantage. The flowers come on the shoots of the same season, therefore the stronger and more length these shoots have the better the display; and the closer the branches are cut back every winter the stronger are the shoots that follow. In this way these shrubs can be kept down to a moderate height, as after every cutting back they are of about the same height as the year before. There are a few of these shrubs having variegated leaves, and these have been used to good purpose by many gardeners to form low hedges, and even as edgings to large flower beds. By cutting them very low every spring and shearing them in midsummer they have an ornamental appearance which is pleasing.—Exchange.

ANNUALS.

Whatever else we may have in the flower garden, we always want a few good annuals. The selection of these is a very easy matter for anyone who has been accustomed to growing flowers for years; but there are always many beginners who are somewhat bewildered by the catalogues and often fail to attain good results through the selection of varieties which need considerable knowledge of floriculture to insure success.

Among those annuals which will grow and thrive and produce an abundance of blossoms for almost anyone, the sweet pea is perhaps the most popular. This plant is extremely ornamental in the garden, and if all blossoms are clipped off as soon as they begin to fade, the season of flowering may be prolonged almost indefinitely, but if seed be allowed to form there will be no more flowers.

The annual aster is exceedingly fine for late blooming; the flowers come in many beautiful colors, and the "branching" type is excellent for cutting.

Phlox Drummondi is a charming little plant, which ought to be more generally seen in our gardens. It blooms continuously from early summer until frost.

Portulaca will grow in hot, sunny places where almost anything else would perish, and it comes in almost all the colors of the rainbow. The double variety is especially pretty.

For a showy bed there is nothing better than the petunia. It should be grown by itself, however, as it does not combine well with other flowers.

The balsam comes in all shades of red, white, pink and purple, both self-colors and striped and spotted. The camelia-flowered strain produces flowers as double and perfect as roses. One peculiarity of this plant is that plants permitted to remain where the seeds are sown often produce only single blossoms, while those transplanted twice from the seed bed will have all double blossoms.

Sweet alyssum is a companionable little plant, which makes neat edgings for beds. "Little Gem" is particularly compact in growth, and covers itself completely with clusters of snow-white, fragrant blossoms. Mignonette is a deliciously fragrant annual, but not showy. It is one of the few things which look best scattered through the garden as though it had just happened to come up there.

For long sprays of green for cutting ,ambrosia is especially desirable. It is at its best when grown in long rows.

The snapdragon is an old favorite which has been greatly improved in the last few years. Not only have new colors and shades been added, but the flowers are much larger, and some varieties are fragrant. With slight protection this plant will live through the winter, and prove even more satisfactory the second season.

For low beds near a path, the verbena is to be especially recommended. The marigold is easy of culture and free-flowering. It comes in all shades of yellow, from the palest lemon to the darkest orange; also in rich browns and maroons.

Very few people seem to know the larkspur, yet it is a most desirable addition to any garden, and a bed of the "hyacinth-flowered" variety will rival in depth and purity of color the real hyacinth.

These are a few of the annuals that any beginners may grow with a reasonable assurance of success, and even if they are rather common, they will be almost sure to thrive and produce an abundance of bright blossoms which will give satisfaction throughout the season.—Wallace's Farmer.

BULB INDUSTRY OF THE NETHERLANDS.

The following information concerning the bulb industry of the Netherlands is taken from an article entitled "Market Gardening in Holland," published in the Department of Agriculture Journal for Ireland.

"Since 1750 the cultivation and export of bulbs has been regularly carried on in Holland, though the trade only reached its present enormous proportions during the last decades of the nineteenth century.

"The bulb-growing industry was first confined to Haarlem and its vicinity, but has gradually extended wherever a suitable piece of land was available. In order to grow bulbs, meadows have been transformed and sand dunes leveled. The preparation of land for this purpose is often very costly, and the value of the best plots varies from £320 to £500 ($1557 to $2433) an acre.

"The export statistics of the industry, which have been carefully kept since 1897, show that the total export has very largely increased in the last ten years. The value of this export can not now be less than £800,000 ($3,893,200).

"England is still Holland's best customer for bulbs, taking nearly 40 per cent of the total export. The number of bulb-exporting firms in Holland is about 200; there are also over 2500 growers who do not export directly, but send their produce through the larger firms. The number of persons employed in the bulb industry is estimated at 4000.

"The Dutch bulb growers are organized into a general federation which now numbers nearly 3000 members, and is divided into thirty-seven local groups. A paper is published twice a week, weekly exchanges are held during the trade season, novelties are examined and reported upon by a committee of judges, and a trade council inquires into and decides all trade differences. Many exhibitions have been organized by the federation, and of late exhibits have also been sent to foreign countries. In addition to the general federation, there are two special societies, one to protect the interests of bulb exporters and the other to protect those of growers who do not export."

DWARF KAFFIR CORN for DRY LAND
No better fodder and grain crop can be planted on dry or alkali and than this prolific member of the Sorghum family. This dwarf variety possesses the advantages of more foliage, smaller stalk and ease of harvesting. Its great root system enables it to produce wonderfully in drought sections, and breaks up new ground for other crops.
FOR STOCK FEEDING
Dwarf Kaffir Corn will produce 10 to 15 tons of green fodder or silage to the acre, or 5 to 8 tons of dry fodder.
FOR POULTRY
The grain is a valuable food for poultry and will crop 2,000 pounds and upward per acre.
Write for cultural directions and price.
Please mark letter Dept. C
Germain SEED & PLANT CO.
ESTABLISHED 1871
SEEDS-NURSERY STOCK-POULTRY SUPPLIES.

LOS ANGELES, CALIFORNIA.

Dwarf Milo Maize and Red Kaffir Corn

The two great drought resisters should now be sown. There is no more profitable dry land crop than these two members of the sorghum family. We have taken particular care in selecting acclimated seed stock of the true dwarf varieties, yielding two to three tons per acre. Write for samples and cultural directions.

Pacific Egg Food

Makes hens lay; none better. Special prices: 90 lb. sack, $1.75; 75 lb. sack, $1.50; ton, $13.50

Seed catalog "G;" Poultry supplies "H;" Which shall we send you?

WEST COAST SEED HOUSE

111, 113, 115 WINSTON ST. between 4th and 5th near Main. **LOS ANGELES**

Pioneer ROOFING

Always dependable—never disappoints. The one Ready Roofing that is right for any building. Made in three weights. Meets every roofing requirement. First cost the only cost. Needs no paint or repairs. Lasts for years. Handy rolls—108 square feet. Everything necessary for laying—nails, cement, etc—in core of each roll. Anyone can lay it. Let us send you samples—and our 32-page Roofing Booklet.

PIONEER PAPER CO., Los Angeles, Cal.

Address Department 11 Pioneer Roofing is for sale by Leading Dealers in building materials everywhere.

Orange Seed

Now is the time to start your Orange Seed Beds. We are prepared to furnish you with Fresh Orange Seed that will produce strong, healthy Seedlings. Ask for quotations, stating quantity required.

MARKET GARDENERS: We make a specialty of catering to your trade and are always ready and glad to help you select those seeds best adapted to your requirements.

NURSERYMEN can find in our Store everything they need in the way of high-class Tree and Plant Seeds as well as other supplies such as Raffia, Budding Knives, Imported Sprinkling Cans, etc. And don't overlook our "Non-Kinkable" Garden Hose if you wish to avoid the constant repairing that the old kind requires.

CONTENTS THIS WEEK

EUCALYPTUS AND CHAPARRAL ON LOMALAND, Cover.
TREE TROUBLES AND THEIR CAUSES, 635.
WITHERTIP AND ITS TREATMENT, 635, 636, 637, 638.
DECIDUOUS FRUIT CULTURE.—Control of Black Peach Aphis, 639.
LIVE STOCK AND DAIRY.—Large Lung Capacity in Cows; Breeding Principles; Zebra-Hybrids; Champion Ayrshire Cow; Warbles; 640, 641.
SMALL FRUITS AND VEGETABLES.—Gooseberry Culture; 642.
ORNAMENTAL GARDEN.—Rose of Sharon; Annuals; Bulb Industry of Netherlands; 643.
EDITORIAL.—Reclamation; Plant Wisely; Enclosing a Stamp; Read Carefully; Better Roads; Memorial Day; Editorial Notes; 644.
AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast; 645.
PRACTICAL POULTRY CULTURE.—Turkey Talk; Began with a Sixpence; Poultry Queries; Meat for Incubator Chicks; 646, 647.
QUERIES AND REPLIES.—Fertilizer for Oranges; Second Growth of Orange Trees; Red Spider; Bee Caralysis; Preserving Flowers; Curing Fur Skins; 649, 651.
HOUSEHOLD DEPARTMENT.—The Battle Cry of Freedom; Recipes; 652, 653.
PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Citrus Market; 654, 655.

This is the time of the year when the commission houses and large handlers of fruits may be dumping into the bay or river quantities of fruit in order to keep up prices. This was done last summer and without question will be this summer. The man who produces fruit will then be called upon to pay the freight to the city, and the consumer who is unable to pay the big prices which the dealers see fit to impose, will be compelled to do without fruit. There is much in our political economy which tends to make socialists.

RECLAMATION.

Making the desert bloom as the rose has been given all kinds of twists and turns, poetical and otherwise, in descriptions of the great work of reclaiming desert lands, but most potent of all have been the actual results in the production of things which have added to human hapiness, and, further, reclamation has vastly increased values of real estate. Without the reclaiming power of water practically all of this land is worthless. With the Roosevelt dam only just completed, lands in the Salt River Valley under its irrigating system are today valued at from $100 to $750 per acre. In California and Arizona, under the Laguna or Yuma dam, lands are worth from $100 to $500. Sacramento Valley lands are not in the class of lands valueless before the work of reclamation, but those under the Orland project have increased vastly in worth; they will now command from $100 to $500 per acre. Even over in Colorado, in the Uncompaghre Valley, $75 to as high as $500 per acre is commanded. So far as government reclamation schemes are concerned, the state of Washington claims the most pronounced case of increase in values in the Yakima system, where lands are now held at from $500 to $2,500.

California has received less material benefit from government work than almost any other Pacific state; the only system entirely within our borders is the Orland, on which less than half a million dollars has been spent, and over 14,000 acres of land benefited. This land has been raised to a valuation of $1,400,000. Of course the Yuma dam covers some land in California as well as in Arizona; in both together about 90,000 acres have been lifted to a valuation of $9,000,000; ultimately it will probably cover a quarter of a million arces worth approximately $20,000,000 to $30,000,000. The Yakima project in Washington, mentioned above, will ultimately cover over 250,000 acres, of which only 17,000 are now under irrigation; these lands when all under irrigation will have a value in excess of $30,000,000. It must also be said of this particular project that its cost to the land owners is the greatest of any of the projects; each one benefited is to pay ultimately the sum of $52. Record for lowest cost is held by the Minidoka system in Idaho and the Truckee-Carson system in Nevada, which will charge $22 per acre.

The feeling was more or less general that changes made in the service might result in less enthusiasm in this work, but we now believe that a pronounced advance will be made in the reclaiming of desert lands. It requires vast sums of money, and the work must be taken up with caution. Some mistakes have been made, and some systems have cost more than they should, but on the whole there is great benefit.

PLANT WISELY.

Commenting on a former Cultivator editorial advising judgment in extensive planting of avocados or any untried fruit, Mr. W. B. Thomas of Wahiawa, Hawaiian Islands, writes:

"I want to indorse your editorial in a recent issue of the Cultivator wherein you advised planters to go slow on avocados. This is undoubtedly a grand fruit, and large quantities are grown and eaten in the Islands, but like many other tropical fruits, one has to acquire a taste for it. Let growers, as you say, set out a few trees, but go slow on heavy plantings till the market comes up. Half a carload thrown on the San Francisco market now would glut it. I know. I sent 27 small crates there last summer, and owed the commission man $2.00 in the settlement."

Orchardists labor under the disadvantage of having to wait years before their product is ready for the market, hence caution and good judgment must be used to prevent the loss of years of labor. We well recall that a score or more of years ago many orchardists planted extensively the Kelsey plum. This fruit of magnificent size and perfect shape appealed to all as having a great future. It did sell well when first put upon the market and in limited quantities yet commands fair prices, but those who planted acres of Kelseys learned that there was no continued demand for them. As Mr. Thomas says above, vast quantities of the avocado are eaten in the Islands, but like many other tropical fruits one must acquire a taste for it. If his 27 crates were sufficient to stall the San Francisco market so that he had red ink returns, it is wise for our planters to experiment before large plantings are made.

ENCLOSING A STAMP.

The Cultivator's query department has grown so much in interest that it becomes necessary at times to answer some of the queries through the mail. Sometimes a mail reply is requested and in such cases a stamp is usually enclosed. This is often gummed to the letter by one corner, and sometimes the entire stamp is stuck on as tightly as if it were on the envelope. The inquirer must realize that these stamps are useless. Where one wishes to send a stamp it is easy to use a little wire paper clip to fasten to the letter or in the absence of this handy little appliance, pin the stamp to the paper. Sometimes they come wrapped in oil paper, which is perfectly satisfactory, but not as convenient for the sender as the other two methods. Again, there are inquirers who do not take the trouble to enclose stamps, but ask for reply by return mail without fail. In business matters no business house expects stamp for reply, but when the information requested is entirely for the benefit of the questioner and of no general interest, such as request for an address, the sending of a stamp is a matter of courtesy and a slight indication of appreciation of the courtesy asked.

READ CAREFULLY.

We have before referred to the fact that some inquiries are made of us for matter fully discussed in the query department of very recent issues. We have referred to this feature before, but still the questions come. It is a habit with many people to merely glance at the paper, then when need for information arises, they ask for special service. In the interests of sparing as much of this repetition as possible, we will ask our subscribers to be observing.

At this time we may refer to the fact that within a few weeks the index for the present volume will appear, making easily available the fund of information published in the Cultivator for the last six months—if the copies have been filed.

These warm days are putting the dry growth in canyon and on hillside in condition for the careless match tossed aside, the cigarette stub, the discharged firearm and the camp fire, to cause immense damage. Everyone who builds a fire for his own comfort when in the mountains on hunt or picnic can at least grant to his state this much protection, that he will see that every ember is extinguished. From this day until the rains come there is constant danger.

BETTER ROADS.

From statistics issued by the office of the secretary of state it appears that California has in excess of $40,000,000 invested in automobiles. That is a big bunch of money and while some look upon it as a vast sum wasted in pleasure we believe a great many of these machines mean economy in the conduct of business and of farming operations. The point has been raised that the good roads movement is inspired by automobile dealers for the use of the sporting class while the farmer pays the largest percentage of the road fund. We must bear in mind that farm produce is moved at a less figure over good roads than over rough ones. If the money raised for good roads is honestly spent, whether it is inspired by sporting man or farmer is a small matter; the point is, get good roads. The farmer in France moves a certain tonnage of produce to market at a cost of $7 while the same tonnage carried the same distance in America costs $25. America is a new country and an enormously big one, and it will take years to put its roads in the same condition as those of France, but with honestly directed effort at road improvement the cost of haulage will be greatly reduced.

MEMORIAL DAY.

The people of America are the only ones who honor the dead and living war heroes by observing a particular day in commemoration. We say the dead and the living because it is as much in honor of the veterans who are still living as of those who are camping "within the low green tent whose curtain never outward swings."

Memorial Day has been observed since a few years after the Civil War, and while some have suggested that with the passing of the old soldiers its observation will cease, we do not think the time will ever come when America will forego the privilege of honoring those who were responsible for our united country. Many think that in making the day one of picnics, sports and pleasure generally, that its sacred nature would soon have no hold. Without question many do observe the day with little thought of its real meaning. Every effort should be made to keep it, as originally intended, a holy day.

The receipt of printed matter from the departments at Washington seems to be rather more liberal this month than for some time. We do not think this is so pronounced as in the month of May of some previous years, but this is the month in which weights of mail are taken to fix the compensation of railways for the coming year and it is charged that in the past officials have found it advisable to send out a large amount of material at this time.

The next meeting of the Holstein-Friesian Association of America will be held in Syracuse, New York, on Wednesday, June 7th. There will be election of officers, reports of committees and general discussion of matters of interest to Holstein-Friesian people. The President is C. W. Wood and the Secretary, Frederick L. Houghton, Brattleboro, Vermont.

Are you proud of being a farmer? Do you realize that you are following the calling that demands a greater knowledge of the forces of nature than any other? Are you aware of the beauties and natural advantages surrounding you? If not, awake.

Agricultural News Notes of the Pacific Coast

Northern California

The Chico alfalfa meal mill made its first run last week.

Hop raisers are anticipating fancy prices for this season's output.

Tomato canning is one of the great industries of Haywards, Alameda County.

Unsanitary dairies is the charge preferred against some Santa Rosa dairymen by the state dairy inspector.

The Lake County Irrigation Company has filed articles of incorporation with a capital of $500,000.

Professor Shaw of the State University reports that Yolo County is adapted to the culture of ramie.

A reservoir will be built near the headwaters of Kelsey Creek; it will have a capacity of 25,000 acre-feet.

Vacaville reports some cherries as dropping prematurely; this is thought to be the result of the cold weather.

The town of Davis claims credit for shipping the first carload of raisins ever sent from the state of California.

The California Country Life Committee held a meeting at the time of the University Farm picnic at Davis.

The Farmers Club of Ukiah recently held a most enthusiastic meeting and discussed problems of the creamery.

Secretary Snow of the State Board of Health reports four squirrels recently found infested with bubonic plague.

The State Master made a visit to the Santa Rosa Grange Patrons of Husbandry and made an address at its last meeting.

A reclamation scheme is under way by which 4,000 acres of Yolo County will be reclaimed and divided into small holdings.

A scheme of drainage which contemplates the reclamation of 26,000 acres of fertile farming lands of Siskiyou County and Southern Oregon is under way.

County Horticultural Commissioner Gallaway reports extensive plantings of new orchards in the neighborhood of Healdsburg, Sonoma County, during the past season.

A meeting was recently held at Rio Vista, Solano County, to discuss the matter of widening the Sacramento in the interest of navigation and better drainage of the river.

The first carload of cherries from Vacaville was shipped on Wednesday, May 10th; it contained 1168 boxes; this was three days later than the first car from the same place last year.

Sonoma County hop growers are jubilant over the fact that one year contracts have been made on the basis of 20 cents per pound; the indications are that even this price will be increased.

Landowners met at Orland, Glenn County, last week and discussed the matter of signing up for water and the management of deliveries under the government project; it is thought 40,000 acres will be signed.

One of the latest granges to be formed in this state is that at Sebastopol, and yet it has the ambition to entertain the coming meeting of the California State Grange. The next meeting will be held on Saturday.

Central California

Sanger, Fresno County, has voted to incorporate.

Porterville, Tulare County, has shipped some of its finest Valencias.

Hanford people are planning for a Kings County Carnival to be held May 23-27.

Hanford recently made a shipment of twelve carloads of fat sheep to San Francisco.

The apricot growers of San Jose are most hopeful of long prices for canning fruit.

Tulare Grange is urging the local board of education to install a domestic science course.

Madera recently shipped the prize car of beef cattle, the steers averaging over 1300 pounds.

A Porterville blackberry grower claims a profit of about $400 per acre from his small fruits.

Santa Clara Valley prune growers are holding at 4½ to 4¾, some even refusing these figures.

Ceres, Stanislaus County, claims almost a monopoly on the production of Caprifigs and the fig wasp.

Kings County poultry men recently met at Hanford and made plans for a poultry show to be held during carnival week.

The Ceres Courier reports the establishment of a new fruit packing concern which will handle peaches and table grapes.

Salinas, Monterey County, is after a bunch of cattle thieves which have taken and slaughtered cattle from various ranches.

A member of the whitefly family is reported by Commissioner Schell of Fresno County as doing much damage in some of the vineyards.

Professor Quayle of the state agricultural experiment station force is investigating in Fresno County methods of destroying grape leaf hoppers.

Fruit shippers of Turlock, Stanislaus County, recently met with railway officials and discussed methods of handling the coming fruit and melon output.

District No. 1 of Tulare County reports the construction of over fifty miles of good roads and a desire for a great increase in road building for the coming year.

The Watsonville Pajaronian reports the formation of a company which will take in investors on the $1.00 per week basis, the money to be invested in a hog farm and its equipment.

Investigations in the San Joaquin Valley on the extermination of the ground squirrel cause sportsmen to fear that the cottontail may be destroyed in the general campaign.

The state fish and game commission is offering $20 bounty for killing of mountain lions. The entire skin of the lion, with affidavit, must be sent prepaid to the office of the board.

The management of the Apple Annual which was such a success last year, has fixed upon October 9th as the opening date, at which time Governor Johnson is expected to press the button which will set things in motion for a still more successful exposition.

Southern California

Riverside is discussing the matter of certified milk production.

Imperial County reports but very few cattle infected with tuberculosis.

Imperial Valley barley is commanding $1.12½ to $1.13½ per hundredweight.

Bloomington, San Bernardino County, reports one of its heaviest plantings of citrus fruits.

Redlands orange growers are taking up the matter of fumigation by a co-operative association.

Of the 2200 acres of apricots in Ventura County 1540 have joined in the co-operative marketing effort.

The Orange County Dried Fruit Association hopes to control an output of 1200 to 1300 tons of dried apricots.

An Orange County celery grower is trying the plan of plowing under barley to fit celery land for bigger crops.

The second cutting of alfalfa was practically destroyed by army worms in several sections of Southern California.

More than 2500 property owners of the Imperial Valley have signed a petition for the formation of a Wright irrigation district.

Imperial Valley alfalfa growers find parasites attacking the alfalfa butterfly which has been such a pest and greatly reducing it.

Owing to irregularity of work the orange packing house at Bloomington, San Bernardino County, has advanced the wages of its packers.

Imperial Valley has had some trouble with vine hoppers, but some growers have found that they can eliminate 75 per cent of them by the use of oil cages.

The El Cajon Valley in San Diego County will observe a Fruit Day. Towns which will unite are El Cajon, Lakeside, Foster, Alpine, Descansa, Cuyamaca, Dehessa, Jamacha.

The Anaheim Fruit Association has issued a circular to its orange growing members calling attention to the need of better orchard care in order to produce the highest grade fruit.

The Alta Cresta Groves of Riverside, formerly belonging to the late C. E. Rumsey, is shipping Valencias and offering to ship under its brands fruit for surrounding sections.

Enormous quantities of gypsum have been located in Riverside County, not for from Blythe Junction, near the Colorado River. Experts have declared that 18,000,000 tons are in sight.

Preliminary work is being done to launch a reclamation scheme in San Diego County. It consists in damming the San Luis Rey River at the lower end of the famous Warner Ranch. The dam will back up water so as to cover at least 5000 acres of the Warner Ranch.

The trustees of the Bonita High school, Lordsburg, have planted one acre each of Navels, Valencias, also Eureka lemons, on the school grounds for agricultural instruction. They are set out in 9-tree plots on which will be tried various fertilizers and cover crops. This is the starting point of a citrus experiment station which is expected to be of great benefit to the district orange growers.

The Coast

Grazing in the Yellowstone Valley is reported as exceptionally good.

The largest field of corn in the state of Washington is at Rosalia and is of 250 acres.

Kennewick, Washington, will ship about 18,000 crates of strawberries this season.

The acreage of corn about Colfax, Washington, will be ten times as great this year as last.

The tendency of the market on wool is upward, Utah growers now receiving 12 to 15 cents.

There are more acres of grain in Whitman County, Washington, this season than ever before.

Heavy rains fell in Eastern Washington and were much appreciated especially by wheat farmers.

The Idaho State Grain Commission has formulated rules regulating the handling and storage of grain.

President Taft will ask congress for $300,000 more to complete the work of control of the Colorado River in Mexico.

Late frost caught many peaches in the orchards near Clark, Washington, on May 9th. Some claim two-thirds of crop gone.

Well drillers at East Selah, Washington, have struck a fine strata of gravel and are getting a good flow at 400 feet depth.

Fruit growers at Wrightville, Washington, are installing a water pressure pipe system and will irrigate orchards with sprinklers.

An Arizona bean grower has 60 acres of beans nearly ready for market which he now considers will bring him about $10,000.

The week beginning May 15th was an exceptionally good one at the Union Stockyards, Portland, extra quality prime steers commanding $7.25.

A sheepshearer at Hooper, Washington, has utilized an electric horse clipping machine for his work this season, and reports excellent results.

Idaho reports fewer sheep this year and consequent shrinkage in the spring clip; it will aggregate in the state about 17,000,000 pounds as against 20,000,000 last year.

The Intermountain Good Roads Association of Washington is building sample miles of model road in different portions as an inducement to a general extension of good roads enthusiasm.

The warden of the Nevada State Prison reports that the farm in connection with the prison will produce this year over 400 tons of hay, and that it is not only self-supporting but of profit to the state.

A poultryman at Standpoint, Idaho, was surprised to find his birds coming home each carrying a card on which was written "Please keep your chickens at home." This card had been attached by a thread to tempting morsels fed to the hens.

The strawberry season began in the Milton-Freewater district on May 15th. This is two weeks later than it has been for many years. More than 100 acres of new plantings were made this spring in that section. Last year's shipments aggregated 70 cars; this year's will reach 80.

BUY BABY CHICKS NOW--Special Prices.

We have 5000 per day of most all standard varieties of chicks. Right now we are making special prices on chicks in lots of 100 or more. Send today and state what kind of chicks you wish, and we will be glad to quote the price. We sell hatching eggs of all standard kinds, also cocks, cockerels, and laying hens and pullets.

Write us your wants today. Largest Baby Chick Dealers in the world. We handled 23,000 baby chicks in one day. That's the largest hatch ever made in one day in California. Get the free 64-page catalog; send today. The world's largest chick dealers.

PIONEER HATCHERY

No Other Ready Roofing Could Withstand This Test

The flame of a powerful blow-torch was placed within two inches of J-M Asbestos Roofing. At the end of fifty minutes (note clock) the roofing was not burned or injured, being only slightly blackened with smoke.

This is one of a number of tests which prove conclusively that the only permanently durable prepared roofing—the one that better than any other, resists fire, acids, gases, rot, rust, heat, cold, and wear is

J-M Asbestos Roofing

Other ready roofings are made of wool felt, rag stock, paper, shoddy, coal tar, and other highly inflammable materials which are an actual menace to a building instead of a protection.

J-M Asbestos Roofing is also the "cheapest-per-year" roofing because it requires no coating or painting to preserve it. The first cost is the only expense.

Most hardware and lumber dealers sell J-M Asbestos Roofing. Sold direct, and applied if desired, where we have no dealer. Write our nearest Branch today for sample of the curious Asbestos rock from which this roofing is made, and our handsomely illustrated Book No. O. 55

Practical Poultry Culture

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will convey a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

TURKEY TALK.

By Mrs. A. Basley.

Letters are coming in to the writer still about turkeys which indicate that more people than ever are taking interest in the turkey business. One letter asks when is the best time for hatching. The best time undoubtedly is nature's own time, that is the spring, but I have successfully hatched and raised turkeys from December to July, in this matchless climate.

I have had turkeys hatched in July that weighed twenty-four pounds (young toms) at Thanksgiving, these, however, lived in a vineyard and had all the grapes to eat that they wanted. They helped themselves. I found that the best matings were from a tom of about a year or eighteen months of age with older hens, although the young hens make good mothers. With turkeys in confinement, remember that their natural food at breeding time is insect life, worms, grubs, grasshoppers, etc., and try to imitate as closely as possible the conditions of nature. Give the turkeys, I mean the parent turkeys, plenty of green succulent food as well as plenty of animal food, with a limited amount of grain. Corn should be avoided, it is too trying for the liver and hard to digest. Corn may be used for a few weeks before killing but is not suitable for breeders unless the effects are counteracted by a large amount of grasshoppers.

A disease called blackhead has attacked the turkeys in the East, in some places wiping out whole flocks. This disease I have not met with in California, except possibly in one instance. I have seen many cases of common liver complaint and by my directions others have succeeded in curing many of these.

The symptoms of blackhead are almost the same as those from common liver complaint; namely, it commences with diarrhoea. The discharges are frequent and generally of a yellowish color. The next symptom is the drooping tail followed by a drooping of the wings, after which death soon ensues. When the disease is at its height the head assumes a dark color, hence the name blackhead. Young turkeys are much more susceptible than the older.

The disease is said to be caused by tiny parasites, which can be detected only by the aid of a microscope. These parasites are sometimes found latent in chickens. This possibly may be the reason that turkeys never do well in the same inclosure with chickens.

Doctor Salmon tells us that the seat of the disease called blackhead is in the caecum. The caecum is sometimes called the blind bowel. It is a sort of appendix in the turkey, having no outlet. It is the two lobes of bowel united by a ribbon of fat (the pancreas). In blackhead and also in some cases of liver complaint an abscess forms in the caecum, but this can only be discovered after death, and I have only found it in a post mortem of one turkey.

First, liver complaint comes from wrong feeding, or overfeeding, which has overworked the liver; secondly, blackhead comes from parasites; thirdly, the symptoms of both diseases are almost exactly the same in the first stages. Doctor Cushman, in discussing this matter, decided that when the bright yellow diarrhoea comes on showing liver trouble, the remedy is something bitter and something sour. This is easy to remember. He also recommends no food but green food and says that turkeys have been known to cure themselves by living on acorns.

My remedy is first a liver pill, or a dose of Epsom salts (about 15 grains) followed by quinine for a week, one or two grains according to the size of the turkey, every night, with sour milk and no food but onions and green alfalfa or grass, keeping this up until cured.

The liver is the largest organ in the body of the turkey, and if you can keep that healthy and active you will have an active and healthy turkey. For this reason I lay special emphasis on the food necessary for the liver of the little turkeys. The food that invigorates the liver the best is onions. One of my correspondents this week asks if it is possible to give too much onion or too much egg to the young turkeys. Not if fed according to my directions in a recent article. You can give both lettuce and onions freely to the little turkeys. The lettuce is 95 per cent water and is refreshing to the bowels and good for the digestion. If you interrogate nature you will find that in the spring time when little turkeys are hatched that the chief food that nature provides for them is succulent green food, and the newly bursting forth insects, the developing bugs and grubs and but very few seeds except those that are sprouting. We can imitate nature in giving tender greens, but the insect life which is so necessary we cannot give enough of, so we must substitute something that resembles it as closely as possible. The hard boiled egg, boiled half an hour to make it tender (if boiled less it is tough) the clabbered milk and the cottage cheese, not boiled but made tender by warming only to a temperature of 98, these are the best substitutes that I have been able to find, and very gradually give the wheat and the oatmeal until at last the turkeys are sporting the red (red comb and wattles), and if we have given them a vigorous constitution by not overtaxing their digestive organs or overworking their livers, or making them take cold by shutting them up at night so that they become overheated (they need the fresh night air), they then are so sturdy that there is no need to worry about them, it would take an axe to kill them. The time of their life called "sporting the red," they need plenty of green food, it is a trying time to some just as teething is to some babies, but those turkeys that have not been overfed in their babyhood, that have not been weakened by lice or mites, get over this period easily and when that is over they grow amazingly.

Keep them growing! Turkeys are such a very profitable crop that it is worth while to give them the green food and the animal food that they need.

You will find that turkeys have little disease except liver trouble, but when the youngsters begin to feel their strength if they do not have free range they will be inclined to scrap together, and it is almost impossible to stop them. I have even known one to break his brother's neck, and they frequently wound each other on the head and neck. The wounds sometimes prove difficult to heal, especially if there is any germ of chicken-pox around, it takes hold and the trouble becomes more serious. The best cure is greasing the sore spots lightly with carbolic salve. This will usually have to be done after nightfall. Twice greasing will cure unless the case is very bad. Turkeys should not be kept in the same yards with chickens, for if the chickens get roup the turkeys are very apt to take it. Use the same cures that have already been given in these columns.

BEGAN WITH SIXPENCE.

A man who began with a sixpence and bred poultry as a boy and has now become the head of one of the large produce houses of England, writes of his first effort in the Small Holder printed in London. We quote from the article and hope it may prove an inspiration to some California boy.

My father, who was in the worsted manufacturing business, had left him at the age of about thirty a farm of

More Inventions by Lee

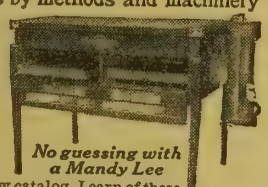
Here's his new Incubator door all are talking about. Perfect ventilation for the *first* time.

Mandy Lee Incubators

supply life-giving oxygen freely to the eggs and just as naturally draw off the poisonous gases. The most important step ever taken in incubator ventilation—neither above nor below, but *right at the eggs*—the correct principle, for the new Mandy Lee is making better hatches of *stronger* chicks than any other incubator in the world.

We Measure Everything

Heat—moisture—ventilation. You *guess* at nothing. If the eggs are good and you follow simple directions your work with a Mandy Lee is as nearly an absolute certainty as anything can be. There is no more reason why you should buy an incubator that regulates nothing but heat than for a farmer to continue to harvest his crops by methods and machinery used 100 years ago. Your success with poultry depends on your ability to select equipment that is *right*—that's what you *always* get from us.



No guessing with a Mandy Lee

Send *to-day* for new catalog. Learn of these new improvements and of our new *out-door, lamp-heated* and *regulated brooder*, just what is needed.

Actions, looks, words, steps are the alphabet by which you may spell character.—Lavater.

about 100 acres in a most delapidated condition at Kirkby Lonsdale. He immediately gave up his business and took to farming.

At the age of four and a half I was sent to the National School at Kirkby Lonsdale. At twelve years of age I was transferred from the National School to the Grammar School, the headmaster of which was the Rev. J. N. Williams, who is now the Vicar of Chapel-le-Dale and a respected judge of poultry at many of the leading shows, and well I remember his coming, as he brought with him a lot of poultry and pigeons—Silver Penciled Hamburgs, Modern Game Bantams, and Russian Trumpeters. These so impressed me that I immediately fell in love with both poultry and pigeons, but how to get them I did not know.

My opportunity came at last. Mr. Williams wanted to go away on the Christmas holidays, and he asked me to feed and look after his stock while he was away. Of course I was delighted, and on his return, because I had looked after them so well for him and kept record of eggs laid, etc., he presented me with a cockerel and pullet, Silver Penciled Hamburgs.

Well, my joy knew no bounds, but then I began to think what I was going to do with them. They could not go with the common farmyard hens at home; I had no house for them, and could not buy one, as I was like most boys, had spent out the pence as fast as I got it.

However, I went to my mother and asked if she would lend me sixpence to buy a sugar-barrel, but the questions I had to answer before I got the sixpence were searching and numerous indeed.

Still, I got the barrel, knocked in one end, put a perch in the center, and hung a sack partway in front to keep out the wind and rain and put it in a secluded part of the farm.

I used to go and feed them morning, noon and night, and very often took them half my own meals, and, though very few people even knew I had them, I managed to rear about twenty chickens.

One day I asked my father if he would enter me a pair at the Kirkby Lonsdale Agricultural Show, at which he always exhibited horses, cattle, sheep, roots, butter, or something of that sort. "Oh," he said, "I know nothing about showing cocks and hens;" but eventually by a great deal of coaxing, I prevailed.

I had no poultry baskets, and the birds had to be on the show ground at 10 o'clock in the morning, but to show how anxious I was, I went and selected what I considered the most forward and best pair I had got, and carried them one under each arm to the show ground at 8 o'clock in the morning, and there I had to wait with a bird under each arm until the pens were got ready.

Mr. Williams, the headmaster, came along with his team in smart poultry baskets, and the usual supply of sponges, oil, etc. About this I knew nothing at this time, so my two poor birds had to go without either washed faces or legs even, but fortunately they had been kept on a very nice run in open grass field, and were as clean and bright as a new pin.

How I remember Mr. Williams coming down the row of pens, scanning each one with a sharp eye as he passed along, and getting opposite my pen, taking a full stop and examining them critically. I then knew for the first time my birds were not the worst in the class by the expression on his face, then he asked me if I knew to whom they belonged. I told him they were mine and that I had bred them from the paid of birds he had given me; he seemed astonished.

On going to school the following morning, Mr. Williams asked me a lot about the birds, and arranged we should go and see the others at the dinner hour, and when he saw them he immediately said: "You haven't shown your best, my boy, for you have far better birds here than the pair you exhibited yesterday morning."

He then arranged for me to exhibit at Bingley, Altrincham and Birkenhead.

The first show was Bingley, the "hot-bed" of Hamburgs, and we put £3 on the pen.

While I was at school on the show day away comes a telegram, which gave both father and mother a shock. As telegrams were of very rare occurrence for them to receive and expensive to send, they both thought someone was dead. However, when I got home from school, father said: "Here's a telegram, something about cocks and hens." What it said was: "Wire lowest price pair Hamburgs, Bingley."

After consulting Mr. Williams, the reply sent was: "Catalogue price lowest." They won second prize and never came home.

I repeated the performance at Altrincham and Birkenhead, and all were sold, so I was getting rich fast now, putting £17 into the savings bank, where it is to this day, and with accumulated interest is quite a nice little sum.

POULTRY QUERIES.

Good Returns.

We note that big egg and poultry stories are in order. Cultivator readers seem to have been inspired and we have the following:

We have six white Pekin ducks, owned by our daughter, Ethel, that were hatched April 21, 1910, and up to April 21, 1911, they had laid 575 eggs. Can anyone beat that?—George McNeil, Buena Park.

We have a turkey that began to lay June 1, 1910, and laid till Jan. 15, 1911. In that time she laid 175 eggs, and now she has eleven turkeys a week old which she hatched from her own eggs.—W. W. Johnson, Buena Park.

MEAT FOR INCUBATOR CHICKS.

I desire to call attention to one mistake that I made relative to raising incubator chicks. My first experience was indeed unpleasant. I had exceedingly good luck in the hatch, but raising them was the trouble. The first hatch I lost nearly the entire hatch, at the same time taking the best care of them that I could; they seemed to get weak and died, and it seemed impossible for me to get any remedy. Finally, through experience, and kindness of a lady that had 15 years' experience in raising incubator chickens—the lady explained to me by saying that she was of the opinion that I made the same mistake that she did when I commenced to raise incubator chickens—"I fed and watered them with all care that I could, yet I lost nearly all first hatching. It was suggested to me that it was for want of proper food, observing laws of nature, and the manner that the old mother hen cares for her young chicks. By rustle and scratch in wood yard, lot and any place where bugs and worms are found, having a small number of young ones, she can obtain what you might term meat supply for the young birds. The incubator chicks have no one to supply them with this kind so the lady made arrangements with her butcher to get a supply of beef scraps, that she fed at least three times a week to young chickens or a small amount daily. The result was that the young birds did fine. I resorted to same plan, and after that experienced no trouble in raising young chickens and at times had 500 in my yard.—Southern Cultivator.

Above all things do not crowd your fowls. Give them plenty of room. Cut the flock in two if necessary, or else add larger quarters. We know a farmer who crowded 100 hens into a house only large enough for perhaps 60 fowls. He got only four or five eggs a day and wondered what was the matter. When he cut his flock down to fifty of the best and most promising layers, he gathered three or four times the number of eggs that he got from his flock of 100 hens and the cost of feeding the fifty fowls was only one-half as much. Furthermore, the chicks hatched from his 50 fowls were much stronger than he ever had before.

To break a dog from sucking eggs, make a hole in the small end of the eggs and pour out part of the contents. Put in tartar emetic, size of a common bean. Stir with a hatpin to mix with the egg. Paste the hole shut with a bit of gummed paper off an envelope, if the mucilage isn't handy, and leave it in a nest where the dog goes to get eggs.

Coulson's MADE IN PETALUMA

Special chick food

If nature hatches the egg, you should save the chick. And you can do it with Coulson's Special Chick Food—the greatest life-saver known in the chicken industry.

This food is the result of years of study to get just the right ingredients in a proper mixture to save the largest possible number out of every 100 chicks.

Coulson's Special Chick Food is an investment, not an expense. It pays big dividends by starting chicks on the road to profit for you. Costs about one cent a chick for four weeks' feeding.

Coulson's Growing Chick Food must be used after the first six weeks, to keep up the steady growth of the chicks up to three months, at which time they are old enough to use Coulson's Egg Food—the standard feed for laying hens.

At your dealer's or from us. Write for the interesting book, "Poultry Feeding for Profit." It's free.

TREE TROUBLES—THEIR CAUSE.

(Continued from Page 365.)

weather the normal green color appears and the leaves soon put on their natural appearance.

A more serious condition of mottled leaf may result from any one of a variety of causes. It does not necessarily indicate any specific disease. There has been, however, in Southern California, particularly during the last year, quite a widespread condition of this sort which appears to be of the same general nature. This condition has been attributed to a variety of causes, most of which probably had nothing whatever to do with the disease. One theory which has been given prominence is that mottled leaf is due to the presence in the soil of an excess of magnesium over lime. Not long previously the opposite theory was held in a similar case in the San Joaquin Valley namely, that mottled leaf is due to an excess of lime in the soil.

An examination of typical cases of mottled leaf all over the affected districts, made in company with Professor J. H. Norton, shows the following facts to be true: The trouble is less generally abundant near the coast and more abundant inland. Oranges are more affected than lemons, and Valencia oranges more than Washington Navels. Oranges top-worked on other citrus trees are worse affected than those which were budded in the nursery. Oranges top-worked on lemon trees are rather worse than those top-worked on orange trees. The worst combination in this respect is, therefore, Valencia top-worked on lemon.) Trees are worse affected on the south than on the north side. The most heavily fertilized groves are as badly and possibly worse affected than those which have received less fertilization. (This is particularly the case in connection with the application of stable manure.) Young buds top-worked on large trees often show mottled leaf for several years, but gradually come out of it and attain a normal condition as the new tops become larger. Trees standing close to corrals or manure piles, where they receive a considerable supply of liquid manure, are likely to be badly affected with mottled leaf.

Subsoil examinations were made in numerous affected groves or parts of groves, together with similar examinations of the soil about the nearest unaffected trees of the same kind. The following facts were observed: Affected groves were underlaid with coarse or sandy subsoil, plowsole, or shallow hardpan. Neighboring unaffected groves of the same combination as to variety and stock, sometimes only a few yards away, were underlaid with a heavier, better water retaining subsoil or were free from plowsole or hardpan. In groves where a certain area or streak of mottled leaf ran through the grove, this corresponded to an area where the subsoil was different, and usually where it was coarser.

All these observations taken together point to one conclusion: namely, that the most prevalent and typical form of citrus mottled leaf is due to an irregular supply of moisture and plant food, and is to be likened in a very general way to a sort of indigestion or irregular nutrition. Here we see the effect of the dry year of 1910. Irrigation was practiced more or less thoroughly during this unusually dry spring and fall, as well as during the summer, but all observation goes to show that in most of the citrus groves the subsoil became much dryer than usual during that season. Orchards underlaid either with a porous subsoil or a hard, impenetrable subsoil were most subject to this condition, as already discussed. The result was that in irrigating only the surface layers of soil were saturated, while between irrigations the soil dried out much more than commonly. This would have the effect of giving the tree an irregular nutrition, soil food materials being taken up at the time of irrigation but being unavailable during periods of dryness.

We are led to the conclusion that this is the nature of the trouble from the facts cited in regard to the soils upon which mottled leaf is most prevalent, the fact that the best fertilized groves were aparently worse affected, other things being equal, and the fact that trees getting an excess of nutriment, like those top-budded and those standing close to manure piles, were worse affected. The fact that interior districts suffered more than those near the coast, and that trees showed more effect on the south than on the north side, indicates that where the sun was hottest, drawing most upon the moisture, the trouble became more pronounced.

We do not wish to be understood that the whole question of mottled leaf may be settled in this manner, but simply wish to state these suggestive facts.

About Withertip.

In addition to the typical mottled leaf, there is now occurring in citrus groves, mostly on the lighter, gravelly or sandy soils, a great deal of dieback, chlorosis, poor growth, lack of fruit and similar trouble. Much of this trouble, however, with many other things with which it has nothing to do, is now being laid to the so-called "withertip" fungus, and some growers are seriously considering spraying their groves with Bordeaux mixture or some other fungicide to suppress this largely imaginary parasite. Most careful and numerous experiments made at this laboratory have shown that it is absolutely impossible, even under conditions much more favorable than ever occur in the orchard, to infect a healthy citrus tree with this fungus. On the other hand, we find that it is a most common inhabitant of trees injured or diseased from any cause whatever. The cases of dieback and similar troubles alluded to above are the direct result of subsoil drouth during 1910, and are to be overcome only by maintaining and improving the moisture content and water retaining capacity of the soil by more abundant or more frequent irrigation if necessary, cultivation, and the addition of water retaining material to the soil.

Little Leaf of the Peach.

The scene changes to the San Joaquin Valley, where much anxiety is felt on account of this compartively new trouble. A recent trip through the affected regions with Mr. Thomas F. Hunt of this department disclosed the following facts: The disease is characterized by the development of spindling, yellow, sickly looking shoots on the new growth, with small, narrow, yellow leaves. The leaves along the shoots drop off during the summer, leaving tufts at the ends. Fruit fails to develop, shrivels and drops. Worst on trees from three to seven years old. This trouble also attacks other stone fruits, walnuts, pecans, and other trees.

Here again subsoil examinations showed that the disease was practically confined to trees on light, sandy soils or subsoils, where the effects of the dry year of 1910 had been more pronounced. Trees on a fairly heavy subsoil, or those which had received abundant irrigation throughout the preceding season were decidedly free from the trouble, even in the worst affected localities. From these facts it appeared most probable, if not certain, that here again serious trouble and a very specific disease had been caused by the preceding, abnormally dry season.

A very significant fact was observed in the San Joaquin, namely, that orange trees growing near peach trees affected with little leaf, and in the same kind of soil, showed typical cases of mottled leaf, while near healthy peach trees the orange trees were likewise healthy. This indicates at least that the same conditions may produce both diseases.

Walnut Dieback and Yellows.

An unusual situation has developed this spring in many walnut growing sections, where large numbers of young trees, from two to ten years of age, have shown a sudden dieback in the tops, some or all of the limbs dying back to the forks of the tree, or, in some cases, whole trees dying to the ground. Much of the wood thus affected is not entirely dead, but sends out belated, weak-growing, yellow shoots and leaves. The lower part of the limbs or trunk sends out strong, thrifty suckers, showing that the root is still active.

Here again we find the trouble most pronounced on soils which for any reason became unusually dry in the fall of 1910, while on heavier soils and where the trees had plenty of moisture late in the season the trees have come out normally this spring. The trouble is in some cases to be connected with coarse subsoil, and again is pronounced in some young orchards on fairly heavy soil where alfalfa is growing between the trees and where continual irrigation and cropping of the latter plant has compacted the soil so that an ordinary irrigation does not reach the subsoil. The effects of frost are associated with the trouble to a considerable extent, the trees being much more easily injured in this way when in a dry condition.

Trees affected in this way should be pruned back to good live wood, if not too far gone, and it is to be expected that a new top will soon be produced. By proper attention to irrigation late in the season, especially in dry years, it is not to be expected that the trouble will occur again save in soils most unsuitable for walnuts on account of coarse subsoil near the surface. We may say here that in choosing crops for interplanting walnuts it is not desirable to let the ground remain in alfalfa too long unless an abundant water supply is available and one can be sure by actual examination that the soil is sufficiently moist at all times, both for the alfalfa and for the trees. In any event, it is ordinarily best to leave a cultivated strip at least eight feet wide on each side of the tree row, and as the trees grow older it is better to plow out the alfalfa and grow some annual crop which will receive regular cultivation as well as irrigation.

These troubles are the most specific ones which have developed as a result of the abnormally dry spring and fall of 1910. Many other similar effects in various plants are being constantly met with. It all goes to show the necessity of actual knowledge at all times of the moisture condition of our subsoils, rather than a blind, automatic adherence to established irrigation customs or surface indications. The most noteworthy feature of Professor King's visit among us last fall was the dry subsoil condition which he disclosed in a majority of the orchards visited, some of them those of our best known growers. Even directly after or during irrigation he showed, by a very simple method of examination, that in many citrus groves the soil was entirely dry below the surface layers. Nothing so impresses and grows upon the writer, as he slowly gains a little experience and insight into the influences affecting plant growth in California, as the overwhelming importance of a uniformly abundant supply of soil moisture. The effects attributed to parasites, lack of fertilizers and all sorts of obscure conditions, which are really due to nothing more than a lack of or irregular supply of water, brought about either by actual deficiency or bad physical soil conditions, are too numerous to mention.

Alfalfa Farms

San Joaquin Valley

3000 acres of irrigated alfalfa and fruit land in 20 acre tracts. On the Santa Fe Main line. Station on the land. In the heart of a proven district.

Merced Colony No. 2

Deep, rich, sandy loam soil; can be worked every day in the year. Abundant water from a long established irrigation system.

Write today for particulars.

Send this to us.

Co-operative Land & Trust Company
595 Market St., San Francisco

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Fertilizer for Oranges.

What should I use for fertilizer for my orchard? It is oranges and lemons alternate rows. Trees are about 15 years old and loaded to the limit. Do not know when they were fertilized. Have plenty of water. Soil red, sandy mixed with a little adobe. Some alkali comes to the surface after irrigation. Manure is not available.—E. J. E., Spring Valley.

This is one of the questions impossible to give an intelligible answer. Orchardists must appreciate the fact that every individual orchard has its own problems and a general recipe or royal road to perfect fertilization is impossible to give. Perhaps the best suggestion we can make to this inquirer is to secure copy of "The Story of the Soil" by Cyril G. Hopkins, reviewed in last week's Cultivator. There are other valuable books which would aid also. This department is intended to be generally helpful, but there are some of the larger problems of agriculture which cannot be given justice in so limited a space. The question of fertilization is a great big one and its best solution is a general information which aids the grower in looking far below the surface of the soil. We may say in a general way that this inquirer should look after his supply of humus, for we note he says stable manure is unavailable; his only other source of humus is green manuring. Humus must be had and a supply of commercial fertilizer is of no value unless humus is in the soil in sufficient quantity. Then without analysis of the soil to give something of an indication of its needs, the only suggestion we could make would be to apply complete fertilizer, or at least one strong in phosphoric acid and potash. Of course, it goes without saying that deep culture and best soil tilth must be given. If a complete fertilizer is applied it might contain say 10 to 20 lbs. nitrogen, 30 to 60 lbs. phosphoric acid, and 45 to 90 lbs. potash.

Second Growth of Orange Trees.

My orange trees are one year old this month and they are not putting out a second growth. Will you tell me why? My soil is what they call dry bog. I have thought trees one year old would have a few blossoms, but mine have not. Do you think they have been irrigated enough?—Old Subscriber, Tulare.

If our subscriber means by second growth the growth which should have started in March or April, then plainly there has been need of moisture at the roots. The orange tree usually puts forth four growths during the warm season with a certain amount of dormancy between. At this time it is possible the trees are dormant and having put forth the regular first growth are resting for the second growth which will appear in a short time. The fact that year-old trees have not bloomed is not to their discredit; it is the province of trees of that age to produce wood growth. Next year will be abundance of time for testing of first fruit. Meantime be sure they have plenty of moisture with regularity.

Red Spider.

What proportion of hydrated lime and sulphur should one use for red spider on peach trees and why is hydrated lime added to the sulphur? Is it more effective in mixture than the sulphur used alone?—Subscriber, Sanger.

Three-fourths sulphur to one-fourth hydrated lime is the usual proportion. This has been found to work more satisfactorily than sulphur alone, possibly because of being retained on the leaf longer. Another formula now recommended by Commissioner Essig of Ventura County is 2½ per cent solution of the common commercial lime-

POTATO GROWERS

know that they cannot raise the crop successfully and economically without a complete line of the best tools for the purpose.

IRON AGE POTATO MACHINES

are built through practical experience growing potatoes and 75 years' making farm and garden implements. This is why we get the right results.

The Maine State Experimental Station, in 1910, made a careful, thorough test, using a "picker" planter and an Iron Age (Improved Robbins) Potato Planter. The average results obtained showed

57 Bushels More Potatoes PER ACRE Where Planted With An **IRON AGE**

Ask us for proof and we will send you bona fide copy of their special bulletin.

100% perfect planting is what you want—no doubles, no misses, no injury to seed.

Man on rear seat makes corrections only.

No. 82. *Pivot Wheel* and *Pivot Gangs.* We make 4 other styles including *2 Row.*

Four Row Sprayer—we make Six and Seven Row also.

Digs all of the crop, and lays them out clean and whole.

IRON AGE Riding Cultivators are furnished in large variety of equipment and sizes. One or two row machines, pivot or fixed wheels, pivot or stationary gangs. Adjustable for rows 28 to 48 inches apart. Teeth adjustable for angle and depth—any size. Concave or convex wheels.

IRON AGE Sprayers will make your crop safe from blight and bugs. Made to cover four or six rows. Single or double acting pumps, 55 or 100 gallon wood or 55 gallon steel tanks—adjustable for 28, 30, 33 or 36-inch rows (and wider if ordered special)—fitted for one or two horses. Many attachments for special work, including one for spraying trees, vines, etc.

IRON AGE Potato Diggers, No. 150

A straight elevator machine, light, yet strong and durable—light draft, no neck weight—digs all of the crop without cutting the potatoes and without handling more soil than necessary—gives perfect separation. Has separate, removable elevator bearings and adjustable steel lugs on the wheels, for side hill work, shifts in and out of gear from the seat.

We will be very glad to mail Diamond Anniversary catalog and booklets concerning each of the above tools, also full line of Garden Tools, Horse Hoes, Horizontal Barrel Sprayers (ready to use), etc. Address,

MISCELLANEOUS

It requires but 2 to 4 cents worth of the darkest and cheapest honey to make a gallon of the richest and most delicious beverage drink. It is a perfect substitute for fruit where fruit is scarce, and a perfect substitute for water where water is poor. A tablespoonful of evaporated milk in a glassful makes buttermilk that is worth twice as much as the natural kind. Process and right to use it two years 25 cents. C. W. Dayton, Chatsworth, Cal.

Ranchers—If you grow anything that can be canned we will supply everything but the labor and product and will pay you the highest market price for it. Write or call Growers Home Canning Co., 222 Exchange Bldg., Los Angeles.

Imported Carneaux—The great squab pigeon. A limited number of mated pairs at $3.00 per pair. Chas. N. Taylor, Artesia, Cal.

MACHINERY

WICK'S FOWL HITE FARM, Moorpark, Cal

CARNEAUX IN CALIFORNIA

Carneaux and Plymouth Rock Homer Pigeons, guaranteed thoroughbred and mated. The largest breeding plant on the Coast. Satisfaction guaranteed. Postoffice Box 355, San Pedro, Cal.

PAPER BERRY BASKETS.

As an economical and serviceable berry basket, nothing can surpass heavy paper, paraffined against moisture and riveted against breakage. Having been on the market for more than two years, and having been found practical for all kinds of berries in any quantity, the paper basket has become a factor in berry handling. It is much less expensive than wood, lighter in weight and equally strong.

The boxes made by Mr. E. F. Adams, of Petaluma, have met every requirement. Last year's users are renewing their orders in larger quantities. You can have a sample by writing the manufacturer. Prices may be found in Mr. Adams' advertisement, on page 642 of this issue.

QUERIES.

(Continued from Page 649.)

sulphur. This is said to work to perfection and be rather simpler to apply than the dust.

Bee Paralysis.

What remedy is there for bee paralysis?—Subscriber.

There is no satisfactory cure for this trouble. Spraying the combs with salt water or weak solution of carbolic acid has been recommended. The best treatment is possibly removing of diseased stock from the stand and putting in its place a strong, healthy colony. We will ask our bee keeper friends to tell of their experience.

Preserving Flowers.

How may I pack roses and other flowers so that they may be sent East?—T. B. F., Chula Vista.

Orange blossoms are preserved by dipping in warm paraffine, directions for which have been given in previous Cultivators. We do not think, however, this would work with roses, at least we never heard of it being tried. We believe the best method is to pack stems in wet moss which will hold moisture and preserve flowers for some days. Sticking the stems in a potato has been recommended. In packing the flowers arrange to have some holes in package to admit air, otherwise they may reach their destination blackened. We will pass this question on to our subscribers and ask for their experience.

Curing Fur Skins.

Please give method for tanning coyote skin, one which will leave the hair on.—Subscriber, Santee.

We take the following from an old recipe book; it is said to be good for all fur skins, but we cannot vouch for it. As this question comes to the Cultivator repeatedly we will ask experience of those who have succeeded with such a process:

Cut off useless parts and remove fatty matter from inside. Soak skin in warm water for one hour. Spread over inside of skin paste made of borax ½ ounce, Glauber salts ½ ounce, water sufficient to make thin paste. Mix. Next double the skin flesh side inward and put in cool place. After 24 hours wash the skin clean and repeat as before with the following mixture: sal soda 1 ounce, borax ½ ounce, hard white soap 2 ounces. Melt slowly and put in warm place for 24 hours. Afterward apply the following: alum 4 ounces, common salt 8 ounces, saleratus 2 ounces, hot rain water sufficient. When cool place skin in it for 12 hours then hang it to dry. Lastly smooth inside with sandpaper and pumice stone.

STAR PORTABLE DRILLING MACHINES

Drillers

Know best why they prefer a certain machine to any other make—it's not merely a notion. They want the one that will ***make the most hole*** in the shortest time, and with the least amount of trouble. They're exactly right.

Star Portable Drilling Machines

are conceded the standard for all Well Work, because of their construction, which guarantees them Economic, Speedy, Simple, Durable—the drillers' favorite.

Reducing Living Expenses

More to Eat, Wear and Use for Less Money.

One of the most widely discussed problems of the age is the cost of high living and the reason therefor. When you commence to study this problem its answer will soon be found when you trace from the manufacturer or producer to your own possession the merchandise which you buy and find the many hands through which it passes, each of which must realize some profit on the transaction.

A little over two years ago the McStay Supply Company, a large wholesale and manufacturing concern of Los Angeles, put into operation a plan to overcome some of the unnecessary expenses incidental to the handling of supplies used in every day life, which would mean a direct reduction of prices to the consumer. The results of their efforts were much greater and more satisfactory than they had dared to hope and the latter part of last year they discontinued their business with the retail merchants entirely, which, up to that time, had been by far the largest part of their business, preferring to go direct to the consumer, thereby eliminating the profits which the retailer must necessarily have in order to support his business.

With their very large volume of business they necessarily have an enormous purchasing capacity which enables them to sell direct to the consumer at prices practically the same as those paid by the retailer, and in some instances even lower. Conducting their business strictly on a cash basis they do not have to assess those who pay their bills for the losses ordinarily sustained by concerns doing a credit business.

When the farmer realizes that the freight rate paid by him for his supplies is exactly the same as that which the retailer has to pay, it disposes of the question of freight entering into his consideration. The railroad companies are not permitted under existing laws to give a carload rate on assorted or mixed cars of different commodities, neither are they permitted to make a lower rate on 10,000 lbs. of one article than they quote on 100 lbs. of the same merchandise. Therefore the small consumer can ship 100 lbs. of goods at identically the same rates at which either the large buyer or the dealer could ship a greater quantity unless it be a straight carload of one item only.

They also purchase dried fruits, beans, eggs, and many other commodities direct from the grower or producer and in turn distribute them direct to the consumer, thus eliminating the middle man's profits. This necessarily results in the farmer getting a better price for his products and the consumer getting more for his money.

They ship goods throughout Southern and Central California, Arizona, Nevada and Western Mexico, keeping closely in touch with market conditions in these various districts and the great growth of their business, which comes to them largely through the efforts or recommendation of those who are already customers, indicates that there is a very substantial saving effected by purchasing direct from them.

They publish a catalogue of sixty-four pages on practically all classes of staple merchandise, including groceries, dry goods, shoes, clothing, poultry supplies, bee supplies, hardware, farm implements, building materials, drugs, etc., which they send upon request, postage prepaid. For the benefit of comparison, they quote the prices on a number of items handled by them herewith, and a careful comparison of these prices with the San Francisco and Los Angeles market quotations on next to the last page of this issue will show that they are actually quoting as low and in many instances lower than the wholesale quotations referred to.

By communicating direct with the McStay Supply Co., Los Angeles, Cal., you can save from 15c to 30c on every dollar's worth of supplies which you purchase, which means $15.00 to $30.00 on every hundred dollars which you spend, an item worth serious consideration.

Macaroni, per lb.	.05½
Chocolates, hand-made, 5-lb. box	1.15

THE BATTLE CRY OF FREEDOM.

Yes, we'll rally 'round the flag, boys;
We'll rally from the plain,
Shouting the battle-cry of freedom;
We will rally from the hillside,
We'll rally 'round the plain,
Shouting the battle-cry of freedom;

The Union forever! Hurrah, boys, hurrah!
Down with the traitors, up with the Stars;
While we rally 'round the flag, boys,
Rally once again,
Shouting the battle-cry of freedom.

We are springing to the call of
Our brothers gone before.
Shouting the battle-cry of freedom;
And we'll fill the vacant ranks with
A million freemen more,
Shouting the battle-cry of freedom.

We will welcome to our number
The loyal, true and brave,
Shouting the battle-cry of freedom;
And although he may be poor he
Shall never be a slave.
Shouting the battle-cry of freedom.

We are springing to the call from
The East and from the West,
Shouting the battle-cry of freedom;
And we'll hurl the enemy from
The land we love the best,
Shouting the battle-cry of freedom.

We are marching to the field, boys,
Going to the fight,
Shouting the battle-cry of freedom;
And we'll bear the glorious stars of
The Union and the Right,
Shouting the battle-cry of freedom.

We'll meet the enemy, boys,
With fearless hearts and true,
Shouting the battle-cry of freedom;
And we'll show what Uncle Sam has
For the loyal men to do.
Shouting the battle-cry of freedom.

If we fall amid the fray, boys,
We'll face them to the last,
Shouting the battle-cry of freedom;
And our comrades brave shall hear us,
As we are rushing past,
Shouting the battle-cry of freedom.

Yes, for Liberty and Union
We are springing to the fight,
Shouting the battle-cry of freedom;
And the victory shall be ours,
Forever rising in our might.
Shouting the battle-cry of freedom.

"The Battle-Cry of Freedom" is one of the many songs contributed to the Union Army of the Civil War by George F. Root, one of the most productive composers of that period. The music, more than the words, tended to its popularity. Its chorus was especially inspiring and while the song is rarely heard today, bands continue to play the music, for it is inspiring march music, particularly the chorus.

When President Lincoln issued his second call for troops, in the summer of 1861, Mr. Root received the inspiration for this song. While a number of the "rallying" cries had already been interjected into the turbulent condition of the North, Root felt that not one exactly met the requirements. He was living in Chicago at the time and was deeply impressed with the mighty significance of the proclamation.

Mr. Root was a member of the music publishing house of Root & Cady at the time. The day following the issue of the proclamation, late in the afternoon, he returned to his home. He seated himself in the parlor with the paper in his hand and was pondering over the conditions of the country. He read and reread the president's call for troops and, laying the paper aside, began evolving in his mind the sentiment of a rallying cry. In an outburst of fervor he received his inspiration.

He took up some paper and began the composition of the words. It was not long until he had written the first verse, for Mr. Root was particularly gifted as a writer of lyrics of this character. Then followed the chorus. After he had finished the chorus, he was particularly impressed with its adaptability to inspiring music. He read it over two or three times, and then went to the piano and composed the music. After playing it over several times he went to work on the composition of the remaining verses.

The following evening the famous Lumbard Brothers—Jules and Frank—the great singers of the war, were to sing at a meeting to be held in the Chicago Courthouse Square. Mr. Root went to see them early on the morning of the day following his writing of the song, and presented them with two manuscript copies. Together the three went to his publishing house and he made them familiar with the music to his piano accompaniment.

After the first speaker had finished at the evening meeting, the Lumbard brothers prepared to sing their first song. It was Root's "Battle-Cry of Freedom." They held written copies of the words in their hands, and when they came to the chorus:

"The Union forever! Hurrah, boys, hurrah!" the effect was electrifying. The audience cheered wildly at its conclusion, and when the chorus to the second verse was started a number of people in the audience joined in, and by the time the last chorus was reached almost the entire multitude joined in its singing. The song had struck fire and leaped into widespread popularity at once.

Only a few days after its writing a monster war meeting was held in Union Square, New York. Excitement was running high and the emotion was intense. In the interim the Hutchinson family, among the most famous of the war singers, had secured a copy of the song through Mr. Root, and they introduced it at this meeting. The immense throng of listeners were aroused to the highest pitch of exaltation at its singing. It was repeated again and again and the great audience caught up the refrain, as did the audience in Chicago, and it proved a resistless force in swelling the ranks of the army.

No other war song was sung with bolder patriotism or with more triumphant passion of the soul. It seemed to mount up as if on wings of magic and was carried all over the North, and into all camps where the Northern Army assembled. It was often ordered to be sung as the men marched into action and more than once its strains rose on the battlefield to stimulate courage.

There is an interesting story related of how this song saved a battle.

During the terrible battle of the Wilderness on the 6th of May, 1864, a brigade of the North Army Corps, having broken the Confederate line by an assault, became exposed to a flank attack, and with heavy loss were driven back in disorder.

They retreated but a few hundred yards, however, when they reformed and again confronted the enemy. Just then a soldier—an unknown hero—in the Forty-fifth Pennsylvania, with a heart full of courage and song, began to sing:

"We'll rally 'round the flag, boys,
Rally once again,
Shouting the battle-cry of freedom."

The refrain was caught up by the entire regiment and also by the regiments next in line. The air was filled with the crackle, and smoke of the burning underbrush; the pitiful cries of the wounded, the rattle of musketry, and the wild shouts of command, gave intense excitement to the scene; but above all, answering the exalted yell of the enemy, rose supreme the inspiring chorus:

"The Union forever! Hurrah, boys, hurrah!"

Among many incidents connected with Mr. Root's war songs, the one which touched him most deeply is related in his delightful "Story of a Musical Life."

"An Iowa regiment went into one of the charges during the siege of Vicksburg 800 strong, and came out with

a terrible loss of more than half of their number. But the remnant of the regiment left the battlefield waving their torn and powder-stained flag, singing:

"'Yes, we'll rally 'round the flag, boys.'"

On the afternoon of July 4, 1896, a vast multitude of 10,000 assembled at the Coliseum in Chicago, the occasion being a war song festival for the benefit of the George F. Root monument fund.

It was a great day for "The Battle-Cry of Freedom." Chicago's greatest singers took the solos and 1000 choir singers sang in the choruses. Jules Lumbard, the white-haired veteran who was first to sing that famous war song, thirty-five years before, sang it at the Coliseum and every soul was thrilled by its new-born power.

Luther Laflin Mills, that superb orator, delivered the oration and among other things said:

"The songs of George F. Root, abide and will remain in the memories and voices of our people, not only as reminders of the Nation's heroic struggle for self-preservation, but as a constant, inspiring and educating force in maintaining and strengthening the lofty sentiment of American patriotism."

George F. Root was born at Sheffield, Mass., in 1820. He was the son of a farmer and the eldest of eight children. He had little early opportunity to cultivate his musical talent, but studied later under George Webb in Boston, and in 1839 became assistant teacher in the music school of A. N. Johnson, an organist in that city, later his partner, and also assistant organist and director of the Winter Street and Park Street churches.

In 1844 Mr. Root removed to New York, where he taught singing in various institutions and played the organ in prominent churches. About this time he married Mary Oliver Woodman, a church and concert singer. In 1856 he went to Paris for a year's study, and upon his return attempted composition. His earlier works and some of his later were published under the pseudonym "Wurzel," the German word for Root.

His first song, "Hazel Dell," was successful, and his cantata, "The Flower Queen," produced in New York in 1881, was unusually so.

About 1860 Mr. Root removed to Chicago and engaged in the publishing business, which realized quick financial results from the publication of his popular songs. He sustained, however, heavy losses in the great fire of 1871, and soon afterward the partnership was dissolved. He continued to live in Chicago, where he composed, edited various works and conducted conventions as before. In 1881 he received the degree of Doctor of Music from the University of Chicago, and in 1886 visited Europe a second time. He died at his home on Bailey island, near the Maine coast, in 1895.

RECIPES.

Eggless Pumpkin Pie.

Prepare the pumpkin as ordinarily, quart pumpkin, 2 quarts milk, season to taste with cinnamon and ginger, and a pint or more of sugar, put the whole in an oatmeal cooker, or packing that in a 10-pound lard pail, set in a kettle of boiling water, let boil and stir five minutes. Then stir in 5 tablespoons cornstarch, more, if wanted thicker. Let stand till cool and put in ready baked shells. Serve, and you will not miss the eggs.

Egg Salad.

Separate the whites and yolks of five hard boiled eggs. Chop the whites finely or run them through a patent fruit press, mix with a French dressing, and arrange on small crisp lettuce leaves, then force the yolks through a potato ricer, and pile on center of the whites. Serve with a French dressing.

"THE FUZZY SQUAB."

The little bride was enthusiastically describing her new housekeeping to her mother. "And once," she said, I cooked squabs for John! He loves them. But I won't do it often—they're so hard to dress. There's so much dirt on them!"—Woman's Home Companion.

Get Oversize Tires

Avoid Blow-Outs—Save Overloading

Goodyear No-Rim-Cut tires—10% oversize—cost no more than tires that rim-cut, or tires not oversize.

The sale of Goodyear No-Rim-Cut tires has multiplied six times over in the past two years. Over 600,000 have already been sold.

Sixty-four leading motor car makers have contracted with us for these tires. The demand from users is now so great that our mammoth factories run night and day.

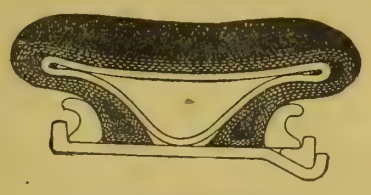
This patented tire has become the sensation. It is saving millions of dollars to motor car owners. It is a tire that you should know.

No Hooks—No Bolts

The No-Rim-Cut tire has no hooks on the base. No tire bolts are needed to hold it on.

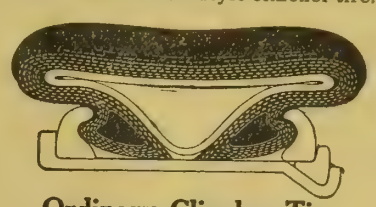
Into the tire base we vulcanize flat tapes made of 126 braided wires. These make the tire base unstretchable. The tire can't come off because nothing can stretch it over the rim flange. But when you remove one flange, the tire slips off like any quick-detachable tire.

This braided wire, flat tape feature is controlled by our patents. It is the only way known to make a safe hookless tire. That is why other tire makers still recommend the old-style clincher tire.



The No-Rim-Cut Tire

This tire fits any standard rim. Simply reverse the removable rim flanges—that is, slip them to the opposite sides. They will then curve outward, as shown in the picture above. The tire comes against a rounded edge, and rim-cutting is made impossible.



Ordinary Clincher Tire

In the ordinary tire—the clincher tire—the removable rim flanges must be set to curve inward. They must grasp hold of the hooks in the tire base, to hold the tire on. Note how those thin flanges dig into the tire when deflated. That is the cause of rim-cutting, which may wreck a flat tire in a moment.

10% Oversize

The No-Rim-Cut tire, where the rim flanges flare outward, can be made 10% over the rated size and still fit the rim. And we give you that oversize without extra cost.

That means 10% more air—10% greater carrying capacity. And that, with the average car, adds 25% to the tire mileage.

This oversize takes care of your extras—top, glass front, etc. It avoids the overloading which causes blow-outs on nine cars in ten which have skimpy tires.

These two features together—No-Rim-Cut and oversize—will under average conditions, cut tire bills in two. Yet these tires cost you nothing more than other standard tires. Do you wonder that men who know these tires insist on getting them?

GOODYEAR
No-Rim-Cut Tires

Our latest Tire Book, based on 12 years spent in tire making, tells many facts which motorists should know. Ask us to mail it to you.

Extracted white	8
Extracted dark	6½
Beeswax, lb	24@30

Hay.

Receipts of hay for the past week were 2938 tons, practically the same as last week. Fancy wheat hay in light bales is very scarce, an occasional car of which sells above our quotations. Fancy red oat hay is almost unknown on this market at the present time, and no doubt would bring in excess of our quotations were any available.

The San Francisco Hay Association has just compiled statistics of the amount of hay on hand in districts sending their hay to the San Francisco market, which shows a total tonnage of 103,950 tons. This is somewhat larger than was anticipated, and will no doubt make up for a good part of the shortage of the present crop, if there be any.

The first car of new hay arrived on this market this morning consigned to ourselves; it consisted of volunteer oat and clover, and was sold at $8.50 per ton. This shows plainly that we may look for considerable hay on this market in the course of the next few weeks. Export demand still continues fair.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	13.50@14.50
No. 1 wheat or wheat & oat	11.00@12.00
No. 2 wheat or wheat & oat	10.00@11.00
Choice tame oat	10.00@12.50
Other tame oat	8.50@10.50
Wild oat	9.00@10.00
Stock hay	6.00@8.00
Alfalfa	9.00@10.50
Straw, bale	40@50

Grain.

Barley, fancy	1.46¼
Barley, good to choice	1.43¾@1.45
Barley, poor to fair	1.40@1.45
Oats, white	1.50@1.60
Rye, new crop	1.40@1.50
Alfalfa seed	18@20
Mustard, brown	4½
Millet	2¾
Flaxseed	5@5½
Broom corn seed, ton	23.50

Feed Stuff.

Alfalfa meal	17.00
Bran, ton	28.00@29.00
Feed cornmeal, ton	33.00@34.00
Cracked corn	33.00@34.00
Rolled barley, ton	31.00@32.50
Rolled oats, ton	29.00@30.00
Middlings	33.00@35.00
Oil cake, ton	40.00@41.50
Cocoanut cake, ton	25.50@26.50
Mixed feed, ton	25.00@27.00
Shorts	29.50@30.00

Magistrate—Why did you strike this man?

Prisoner—What would you do if you kept a grocery store and a man came in and asked if he could take a moving picture of your cheese?

Eggs are delicious if scrambled with cheese. Scramble them as usual except that at the last, just before the eggs are done, some grated cheese is stirred in. For three eggs two tablespoons of cheese should be used.

Citrus Fruit Market

LOS ANGELES, May 24, 1911

The earliness of the season, which proved so great an advantage to growers of Navels with holiday and other early shipments, is a great disadvantage at this end of the season. Notwithstanding the exceptionally firm condition of the market up to a week ago, the quality of the fruit and the excess of large sizes has forced a lowering of quotations on Navels. In fact, the better trade has turned quite decidedly to Valencias, which are now going forward rapidly. Of these there will be probably in excess of 8,000 cars, but with the cleaning up of the Navels, Mikes, Seedlings and others, and a clear field, it is presumed that all Valencias will command excellent returns. Of the Navels and others than Valencias there are all told 700 to 900 cars to go.

The lemon market leaves nothing to be desired; in fact, prices are so good that some friends of the industry have feared it might cause a slowing up of consumption, but the entire Eastern market has been cleared of all surplus stock by the extreme heat of the last two weeks, and the number of foreigns afloat or in sight is not more than 50 per cent of one and two years ago at same date. The fruit is readily commanding $4.50 to $5.50 f. o. b. Eastern points.

Shipments.

Shipments of oranges to date since November 1st, 1910: 27,803 cars, lemons 3,551; total 31,354. To same date last season: Oranges 19,044, lemons 2,540; total 21,584.

LOS ANGELES—May 17.—One car Valencias, two cars sweets, one car seedlings, two cars navels, one car lemons sold.

Deciduous Fruit Market

Manager McKevitt of the California Fruit Distributors, reports:

Sacramento, Cal., May 20, 1911.

The following number of cars of deciduous fruit shipped to all points by all members of this company for the week (7 days) ending Friday night, May 19th, 1911:

Cherries: 5 cars. Cherries have ripened very slowly during the last week, but are expected to come forward more rapidly during the next ten days as the weather, which has heretofore been cool, has changed, and it is now very pleasant. Owing to the cool weather the quality of the fruit should be fine, and it is expected that from now on it will average a better quality than in previous seasons.

Apricots: Since our last letter there has been no change in the apricot situation, except that the crop in the Winters section perhaps looks a little more promising than it did. The fruit is absolutely clean and promises to be of fine size.

Plums: The plum crop continues to look fine and some varieties are so heavily laden that they are now being thinned. This will not be necessary on several of our best varieties and it is expected that the crop will be as good as heretofore indicated.

Peaches: There is no particular change in the peach situation except that there are some indications of a heavier crop than usual in June. It is hoped that this will not occur, as the crop is already fairly light and we can use to good advantage all the fruit that is now promised.

Bartlett Pears: There has been a little change in the situation on this variety, especially in the river section. While some orchards have lost practically their whole crop, owing to the thrips, the orchards unaffected will produce a larger crop than usual, and it is now expected that the crop of this section will be fully equal to that of last year. The fruit is large and fine, and free from scab and other defects.

Grapes continue to look very promising.

Since our last letter there have been showers of rain in various localities in the state. These, however, were followed by drying winds and it is expected that little damage has resulted from same. The weather, which has been very cool so far this season, changed two or three days since and is now warm and pleasant. With a continuation of this weather the lateness of the season will be partially overcome on the later varieties, and it is expected that we will not be more than a week behind the average season.

HOW TO CHOOSE A GAS ENGINE.

The above is the title of a book which should be in the hands of every one interested in gas engines. It contains much valuable information and will be sent free by the California Hydraulic Engineering Company, 70 Fremont St., San Francisco.

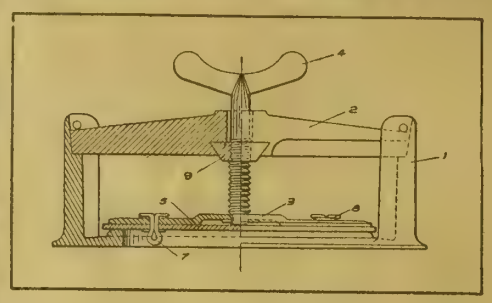
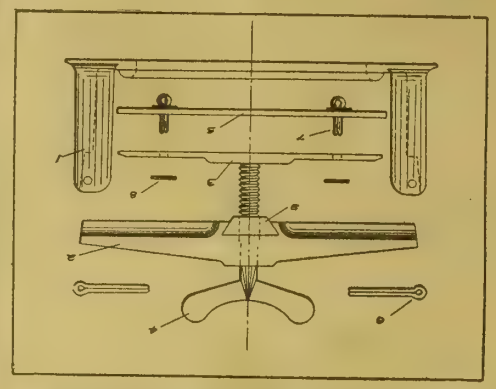
POMONA CIRCULAR VALVE





THE main object of the Pomona Valve is to construct a very cheap and simple valve, and one that requires no special tools or wrenches or experience to operate.

The Pomona Valve is constructed with non-corrosive parts, thus insuring a workable valve regardless of infrequent use. All fastening held in place by cotter pins, thereby making a very cheaply constructed valve and yet a very substantial one.

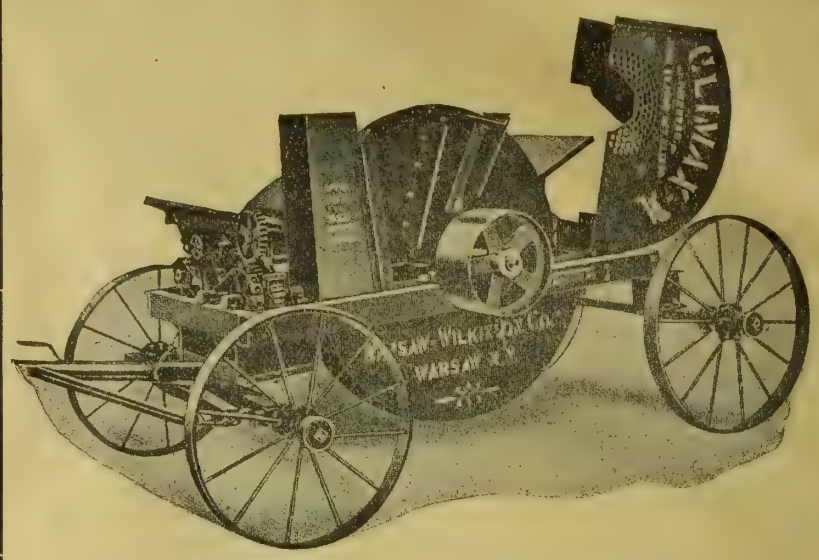
Climax Ensilage Cutters



In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequaled in simplicity, strength, durability, convenience and safety in operation, and the excellent quality and uniformity of the silage. We received at the

St. Louis Fair the Only Award

for ensilage cutter of the side-wheel type, 5 to 50 tons of green corn per hour, where cut in one-half lengths, other feed in proportion. For further particulars, call on or address

Physical Condition of Soil and Tree Important

Recent Discussion as to Causes of Chlorosis Revived and Suggestions Made by C. B. Lipman, of the University of California

The recent discussion which has been going on in Southern California and especially in the Covina district, with reference to chlorosis, has been instrumental in circulating certain opinions from professional chemists and growers which careful experiments of the present and past will not support, and moreover, opinions which are likely to bring about a good deal of mischief through the schemes which they will be instrumental in inaugurating in the practical management of orange and lemon groves. I deem it of great importance, therefore, to make a statement with reference to the above mentioned discussion and especially to show that the above mentioned opinions are not tenable and not supported by the facts. I should be pleased, therefore, to have you publish in the California Cultivator the following statement:

The abnormal condition of citrus trees which manifests itself in the yellowing of the leaves and the later dropping of the same and also of the fruit, to which the name "Chlorosis" has been given, would seem to be caused, from the evidence which we have at hand now, by various factors which may in one way or another enter into the malnutrition of the tree or influence the water supply or, through the mechanical condition of the soil, the air supply. Instead of recognizing this condition with reference to chlorosis, for which we have innumerable instances as proof, Dr. R. R. Snowden has tried to show that in the case of the Covina orchards, where an unusual number of trees have recently shown chlorosis, this condition is due to an abnormal ratio between the lime and magnesia in the soil. He has based his contention on the work of Oscar Loew, to whom we are indebted for a great deal of our knowledge with reference to the functions of lime and magnesia in plants and soils. Doctor Loew and others who have recently worked on this problem, seem to be of the opinion that lime and magnesia are not only both necessary for plant growth, but that some ratio between the two seems to be required for a good growth of every class of plants under otherwise proper soil conditions, but further, that it cannot be made by any manner of means a hard and fast rule which any one can follow for any plant, and besides that, the ratio may vary within wide limits. However, it seems that Doctor Snowden has built his theory with reference to the chlorosis in the Covina orchards on the earlier work of Loew in which the latter tried to state in a general way that a ratio of about two or three of lime to one of magnesia was necessary for proper plant development. With this as a basis Doctor Snowden has examined chemically many samples of soil (I believe that they were 6 in number) from the groves of the Covina district where chlorosis existed and where it did not, and found by his method of chemical examination of the soil that the magnesia was present in too large a quantity as compared with the amount of lime in the same soil and concluded, therefore, that it was the excess of magnesia which was acting as a toxic agent and manifesting itself in the condition known as chlorosis.

On inquiring of Doctor Snowden what his method of analysis was, I was informed that he digests his soil for one-half minute in hot dilute hydrochloric acid of the strength of one to five and then carries out the method of analysis very much in the same manner as other soil chemists. When we compare this method with that of the method used by the official agricultural chemists, or with the method used at this experiment station, we find that the length of digestion differs from Doctor Snowden's in the two cases just named very markedly; that is to say, in the official method, the length of digestion is ten hours on the steam bath, in our method the length of digestion is five days on the steam bath and in both of these cases, the acid used is concentrated hydrochloric acid, which is five times as strong as the acid used in Doctor Snowden's work. It struck me that this radical difference in the length of digestion and the strength of acid ought to have markedly different effects in the extraction of the mineral constituents of the soil and, I therefore, inaugurated some experiments of the extraction of soils by the three methods above mentioned in order to obtain a fair comparison and, to keep as close as possible to the conditions which Doctor Snowden had, I employed two Covina soils, which I had received from some growers there, and on which they had complained there were trees showing chlorosis more or less markedly. In the small table below given there are shown the amounts of lime and magnesia found in the two soils above mentioned by the official method, our method marked "Hilgard" method and by the Snowden method.

	Soil	Official	Hilgard	Snowden
Lime	No. 1	1.19	1.82	.51
Lime	No. 2	.....	1.82	.64
Magnesia	No. 1	.93	1.23	.42
Magnesia	No. 2	.....	1.68	1.02

It is evident from the above table that the length of digestion employed for the extraction of a soil's constituents has a great deal to do with the amount of lime and magnesia extracted so far as the ratio between the two materials is concerned, or, in other words, there is as large an amount of magnesia or a larger amount, obtained by the Snowden method than there is of the lime, whereas, the opposite is true in the case of either of the other two methods. This is undoubtedly due to the fact that the magnesia compounds go into solution in the acid first and in a very short period of digestion, such as that used by Doctor Snowden, the amount of magnesia shows up larger and therefore would seem to indicate when Loew's work is taken as a standard, that there is an abnormal ratio between the lime and magnesia. When the results of the other methods are examined, we find that the lime is not only not smaller than the magnesia in amount, but is actually larger and exhibits a ratio to the magnesia, which is very much like that first recommended by Loew, as the approximate ratio necessary between the two, for plants in general. It would, therefore, seem, from the table and the remarks above made, that there is no justification for believing that the excess of magnesia in the soils of the Covina groves is responsible for any abnormal condition in the tree whether it be chlorosis or any other. On the other hand, it is very important to point out here that not the total amount of lime, but the form of the lime in the soil has an important bearing on the productive power of a soil. For example, if lime is present in a soil in considerable amount as a total and yet only in very small amounts as the carbonate, the decomposition processes due to the decay of organic material may be instrumental in bringing about an acid condition in the soil, especially where green manuring is followed or where large amounts of barnyard manure are applied. In both cases to be sure, that is whether the lime-magnesia ratio is not normal, or whether the lime carbonate is too small in amount to allow of an alkaline condition in the soil, the remedy would be the application of lime, but I think that it is exceedingly important to point out for what reason the lime should be applied and not to base such lime applications on an erroneous notion.

The latter idea with reference to the form of the lime in the soil is also borne out by tests which I have made on several soils sent me from Covina by some of the growers who are troubled with chlorosis in their groves, for I have found on testing these soils that they are either slightly or strongly acid in reaction when tested by our qualitative test with the litmus paper. It should also be stated here that in addition to the fact of the erroneous basis on which lime applications are recommended from the results obtained by the Snowden method of digestion, the form of lime recommended for application is one which cannot neutralize the acidity in a soil if it exists. We have had inquiries from several growers asking whether it is advisable to apply large amounts of gypsum to the soil in order to establish a proper ratio between the lime and magnesia in the soil. One grower, it has been reported, has gone to the extent of applying 50 tons of gypsum to the acre where he was told an abnormal ratio existed between the lime and the magnesia. Now, while it is obvious that if the latter was the trouble the gypsum would probably remedy it, it can also be plainly seen that if it is merely a matter of acidity caused by the lack of lime carbonate and not by an abnormal lime and magnesia ratio then only an application of alkaline lime, such as slaked lime, or lime carbonate could improve the condition of the soil, since gypsum is a neutral salt, like common table salt, and cannot neutralize the acid of the soil. Moreover, grave dangers lie in the aplication of gypsum, to such an enormous extent as that just mentioned, for the reserve potash supply in the soil will thus be made available all at once, and in a short time will be instrumental in impoverishing the potash content of the soil.

The few facts which have come to light since we have begun to look into the chlorosis of citrus trees seem to point to the conclusion with which I started out in this letter, namely, that a large variety of conditions, or, in fact anything that will make for an abnormal condition in the soil may produce chlorosis; for example, in the case of the heavy soils of the Porterville groves, the experiments of Doctors Hilgard and Loughridge would seem to indicate that poor drainage conditions are responsible for the yellowing of the leaves on the trees and the dropping of the fruit. In other cases it would seem that a lack of moisture is responsible for this abnormal condition and that will undoubtedly hold in the very light soils of the Covina district and in other sections of California where groves are planted on deep coarse-grained soils which do not adequately retain their moisture. I believe that this same fact was pointed out to the growers in some parts of Southern California some years ago by Doctor Hilgard when he was making an investigation into the moisture conditions of those soils. These and other manifestations, such as acidity, which we have had in the various groves in which chlorosis occurs, seem therefore to strengthen the idea that chlorosis is not a definite disease caused by any one factor and by no other, but rather may be a manifestation of anything which interferes with proper plant nutrition. I believe, therefore, first that if chemical analysis is to be brought in to help in the solution of this problem it should be done by either our method or the official method, or one that is sufficiently like them to give concordant results and results that more nearly approximate the actual conditions which exist in the soil. Secondly that the very rapid decomposition processes which take place in the soils of the arid region which are irrigated and the consequent solution of the lime carbonate from the surface layers and its washing downward to the lower layers of the soil, may be instrumental in producing acid soils which may bring about chlorosis. Therefore, means should be adopted, immediately, by the fruit grower to ascertain whether or not his soil is acid. This can be done very simply by the litmus paper test which we shall be glad to describe to any grower who wishes to make it, or, the samples can be sent to our laboratory to be tested for acidity. Thirdly, the physical condition of the soil should be looked after in order to determine whether or not the proper water conditions exist there. In other words, we shall have to make sure of good drainage in the case of the heavy soils in order that the roots and the bacteria may have good conditions for their development. In the light soils we shall have to resort more largely to green manuring and other means that may be in our power to improve the water-holding power of the soil. Among these may be mentioned the breaking up of plowpan, or irrigation hardpan, irrigation with smaller amounts of water at more frequent intervals so that the trees may have a larger supply throughout the whole season at their command, and, perhaps, by first packing the soil before arranging for the surface mulch through the summer which must be carefully looked after in order to prevent evaporation so far as may be possible.

I believe it absolutely necessary that these facts and suggestions be given as much publicity as possible in order that the growers of the state may be acquainted with the facts which exist. To be sure there is still a great deal of room for the investi

Citrus and Tropical Fruits

NITRATE OF SODA EXPERIMENT.

By Kenneth MacRae.

Since Dr. King condemned the use of nitrate of soda in our groves, your valuable paper has had several instructive articles on this subject, giving the experiences, beliefs and theories of the several writers.

I have used nitrate of soda almost exclusively for four years on 100 acres of citrus groves, six separate, different pieces, in as many varieties of soil as we have in Rialto, and my experiment has been so far entirely satisfactory, and certainly economical, —cut two-thirds off my fertilizer bill.

I apply four or five pounds per tree, generally in one application, in early spring, right on the cover crop, and plow and disc when I get ready, three weeks or a month later. My trees are thrifty and average with the best here. The fruit is abundant, sound, smooth, good-size and a fine keeper; few drops.

I tried it first on St. Michaels; have five acres that would bear a large crop one year and short crop next, and almost drop the whole before they were ready to pick. For the past four years I have had good crops yearly, of large, sound fruit, and practically no drops.

Most of my groves have had an abundance of bone and potash before the soda era. This gave some of my friends the opportunity to say, "It's not the soda alone; the bone and potash already in the ground are still doing good work." To offset this: three years ago I bought two run-down groves; one twenty acres of Mediterranean Sweets and ten acres of old neglected seedlings. They were both as mean rundown failures as I have seen here or elsewhere, and neither had received a pound of commercial fertilizer before my purchase; I gave each about three pounds to the tree of soda, watered and cared for them, of course. The first year I harvested principally a heavy crop of gophers, but the trees showed a marked improvement within sixty days. They are today as dark green and thrifty as any grove, and bore increased crops of good sound fruit for the past two years.

The theory that you must use soda often; that "it is like a drink of whiskey, etc.," is nonsense. My experience of one application and never more than two, and both in early spring, refutes this. I have often compared it to giving a horse a teaspoonful of flax seed daily for a month in spring. It will enrich his blood, smooth his coat, seemingly give him a start that lasts the remaining eleven months.

Now, fellow growers, I am giving merely my experience. I am not advising you to follow. I am neither agent or broker for soda, but thought that my test of four years might be of interest to the general reader. I would, however, like to have a few enterprising growers who do their own thinking try a few rows of soda alone for say five years. Put, say five or six pounds of soda on a few rows and 25 or 40 pounds of commercial fertilizer on the balance. Do this for a series of years, keep books on returns, and give the readers of the Cultivator the benefit of your experiment.

Hunt up Dr. Schreiner's article along this line, published in the magazine part of the L. A. Times of March 19th. He contends that there is no worn out or poor soil, but that a continuous one crop poisons the soil, and that fertilization acts, not as a plant food, but as an antitoxine. If thirty cents of soda is as efficacious as an antitoxine as a dollar's worth of commercial, it is the stuff to use.

IMPORTATION OF BANANAS.

Four thousand million bananas were imported into the United States in the calendar year 1910. The banana habit is a growing one in the United States. In the early eighties the value of bananas imported, according to the figures of the Bureau of Statistics of the Department of Commerce and Labor, ranged between one and two million dollars per annum; by 1890 the value had increased to four and a half million dollars, in the fiscal year of 1900 to nearly six million dollars, and in the calendar year 1910 to practically twelve and a half million dollars. The rapid growth in this class of importations led the Bureau of Statistics a few years ago to call upon collectors of customs for the quantity as well as the value imported, and the figures of quantities, beginning with the year 1908, showed for that year 35,750,000 bunches; in 1909, 39,500,000; and in 1910 a little over 40,000,000 bunches were imported. Assuming that these average 100 bananas to the bunch, a figure which the importers state to be a conservative estimate, the total number imported in 1910 would aggregate approximately 4,000,000,000 bananas.

The value of the bananas imported in the last decade aggregates, in round terms, $100,000,000. In the calendar year 1901 the total value of bananas imported was $6,750,000; in 1905, $9,750,000; in 1907, $11,750,000; and in 1910, $12,500,000. These figures of the values of bananas imported are the valuation at wholesale prices in the countries from which exported to the United States, and the average price per bunch was 31 cents, as will be readily seen by dividing the 40,192,958 bunches imported in 1910 into the stated value of $12,433,334. How much money is paid by consumers in the United States for bananas cannot be estimated with accuracy, though the cost of freight and the profits of importers, wholesalers and retailers must add very materially to the $12,500,000 paid for them in the countries of production.

Central America and the West Indies are the chief sources of supply of the bananas imported into the United States. Of the 40,000,000 bunches imported in the calendar year 1910, 21,000,000 were from Central America, 13,500,000 from British West Indies, 2,500,000 from South America, principally Colombia and Dutch Guiana, 2,000,000 from Cuba, and about 1,000,000 from other countries. Costa Rica is the largest source of supply in Central America, Honduras second, and Panama third; and Jamaica is the largest source of supply in the West Indian Islands. The United States is the world's largest importer of bananas. The United Kingdom is the next largest importer, her imports of this article in the calendar year 1909 being 6,250,000 bunches, as against 39,500,000 bunches imported into the United States in the same year.

Practically the entire banana supply of the United States comes from abroad. Efforts have been made from time to time to develop the banana industry in the extreme South and in California, but the domestic production is inconsiderable when compared with the importation. The banana, while probably a native of India, is now grown in practically all tropical countries, and among a considerable part of the human race ranks as high as do cereal grains among the people of the temperate zones, and it is said to produce more food upon a given area than wheat. The consumption of bananas in temperate zone countries has increased enormously in recent years. They are used chiefly in the natural state, but in smaller quantities, in the form of banana flour made from ripe fruit. Small quantities of this flour are imported into the United States, but in such inconsiderable amounts that the Bureau of Statistics has not up to this time found it advisable to separately enumerate it among articles imported.

PAPAYA IN HAWAII.

Former articles on the growth of the papaya have created so much interest that we recently wrote to Mr. W. B. Thomas of Wahiawa, near Honolulu, Hawaiian Islands, and asked as to growing and marketing of this fruit and from him we have the statement given below. But first, we call attention to comment by Mr. Thomas on an article appearing in the Cultivator May 4th: "In referring to the statement that the young fruits are cooked before eating, Mr. Thomas

GOVERNMENT PHOSPHATE LANDS

states that this is rarely done, though they are often combined with other fruits and made into preserves. Another point he questions is that sometimes small branches are cut off and readily rooted. Small plants grown from seeds are very difficult to transplant, but seed are often started in beds from which they may be taken to the open ground without shock to the young plant. The use of the fruit as a cosmetic is unknown in the islands.

"The papaya might justly be called the national fruit of Hawaii as there is undoubtedly more of this fruit eaten in the islands than any other. It is particularly popular as the beginning of the breakfast and is an excellent substitute for muskmelon. Many prefer it with a little lime or lemon juice squeezd over it; others with just a sprinkling of salt. At first trial some do not like them, but a taste is soon acquired and after that one never tires of them, and they are to be had every day in the year at any fruit stand at from five to ten cents each. When ripe the papaya is a deep yellow clear through, the flesh just soft enough to be eaten with a spoon. The usual way of planting the seed here is to put a dozen or so where you want the tree to grow and after the plants are three or four inches high, pull out all but the most vigorous one. The tree will attain a height of eight or ten feet and bear fruit in one year from planting of seed, if in good soil and given good cultivation. Male trees can be distinguished from fruit bearing trees by the blossoms which grow on stems three or four inches long, while the blossoms of the fruit bearing tree grow directly from the trunk. One male tree should always be left.

"There are only two varieties grown in Hawaii, and they only differ in shape. One is almost round and the other oblong. Specimens are sometimes seen that weigh 15 or 20 pounds, but the average size is from four to six pounds. A thrifty young tree will produce several hundred pounds of fruit a year. After the trees are four or five years old the fruit begins to get smaller and it is best to make new plantings. The papaya is not used for preserves except in combination with pineapples or lemon guavas. These make a delicious marmalade or jam.

"A few years ago there were some papaya trees growing in Eastlake park in Los Angeles, and they could no doubt be grown in many protected places in Southern California, but it is doubtful if they would bear fruit, as it is strictly a tropical tree."

GOVERNMENT PHOSPHATE LANDS

Two years ago last December the government awoke to the fact that American phosphate lands were being largely exploited for the benefit of foreign users of this precious mineral fertilizer, over half of the American production being exported; also that the public phosphate lands were rapidly passing into the hands of private owners. Large areas of lands underlain by phosphate rock in the recently discovered fields in the public-land states were immediately withdrawn with a view to securing legislation which would prevent exportation of the phosphate. Since then important geologic investigations have been prosecuted and new deposits of phosphate discovered by the United States geological survey. The area now standing withdrawn is over two and a half million acres, containing an aggregate of many hundred million tons of phosphate rock and having a very great potential value to the farming industry.

To make this phosphate rock readily available as a plant food it is necessary to treat it with sulphuric acid, thus converting it into acid phosphate, or "superphosphate," and it is an interesting fact that at least one of the areas withdrawn is in close proximity to the western copper smelters where large volumes of sulphuric acid fumes are now a daily unutilized by-product.

The following table shows the acreage and location of the government's phosphate areas standing withdrawn from public entry on April 1: Montana, 33,950 acres; Florida, 37,439 acres; Idaho, 1,101,517 acres; Utah, 107,745 acres; Wyoming, 1,267,494 acres; or a total of 2,548,145 acres.

Deciduous Fruit Culture

THE BLACK PEACH APHIS.

By Prof. C. W. Woodworth, of University of California.

A very cursory examination of the infested orchard at Lankershim is sufficient to show that the insect is very completely under control at the present time. This is the result of a three years campaign aimed at the eradication of the insect. Whether there has been any real progress toward eradication it is difficult to say. It is possible that a continuation of the present vigorous policy may ultimately accomplish the total destruction, but there is no reason to expect this to occur for some years to come, and perhaps not without the final destruction of the orchards now infested.

No one questions the desirability of ridding the peach orchards of this county of the aphis, even at considerable expense, but it is desirable that the cost and conditions under which the work must be done be well understood. Thus far the county has been operating under the state law, which requires the eradication of any such pest by the owner of the orchard, and if he refuses or neglects to accomplish the work, it directs the county horticultural commissioner to do it at the expense of the grower. This law was first enacted many years ago at a time when it was supposed that the eradication of insects was a comparatively simple matter, but it has proven otherwise, and there is no case on record in the whole history of the horticulture of California, or of the world, where a well established injurious insect has been eradicated. On the other hand, there are many cases in which small colonies of many different kinds of insects have been annihilated, and most people believe that though the provisions of the law have never been carried out in the case of larger infestations, the work may be possible, and the officers entrusted with the duty should perform it.

There is no insect now in Los Angeles County against which there is more justification for these officers attempting to carry out the provisions of the law. The state law provides that the orchardist first be given the opportunity to do the work himself, and only upon his refusal or neglect, that is, his failure to accomplish it, can the county official take up the work. If the county commissioner does the work, he files a lien on the property, but he has no basis for such lien. The fact that such liens have been filed and collected in the past where eradication was not accomplished does in no manner establish their validity. Of course there is the possibility of a difference of interpretation of the meaning of the term "eradication." A very common usage when applying the term to scale insects has been to consider a treatment to be an eradication if the insect is temporarily reduced to non-injurious numbers. Such an interpretation cannot be made to apply to the work against the black peach aphis, since most of the trees treated have never had the insect present in injurious numbers. The mere control of insects, the simple reduction of the numbers to a point where the injury becomes negligible, was in no manner contemplated by the law, and the attempt to apply the law in such cases has no legal basis. The law was intended to furnish the means of handling just such situations as is presented in this case of the black peach aphis.

In reference to the more important and fully established insect pests like the black scale and the codling moth, all admit that with our present lack of knowledge of the means of eradicating insects, the law makes a requirement impossible to fulfill, and is therefore inoperative, and in the present case, if the black peach aphis finally proves uncontrollable, it cannot be considered as coming under the provisions of the law, according to the legal axiom that no law can require the impossible.

A fatal defect of the existing law is that it does not provide adequate means of handling actual conditions. Take the present, every case in fact is mainly in the nature of an experiment. If such a colony of the black peach aphis had been exterminated anywhere else, and the methods tested out so that the officer in charge of the work could confidently depend on the results of the treatments, he could go ahead and perhaps have a legal right to assess the costs against the property, but if he fails it is certain that such experiments could not either in law or in equity be chargeable against the person who was unfortunate enough to have his orchard become infested through the failure of these same officers to protect him by an effective inspection of nursery stock. Particularly is this true when these officers are compelled, in the absence of anything better, to use methods such as treating the ground with carbon bisulphid, or spraying and fumigation of the tops, which, however effective as control measures, have uniformly failed in every case where they have been applied for eradication of an established insect, except when so applied as to destroy the infested plants.

This difficulty could be largely avoided if the county assumed the financial responsibility of the work. It is probable, also, that it would be better to provide for its continuance under a county ordinance avoiding a fundamental unconstitutionality of the state law which has never been adjudicated but which many have known to exist. The horticultural law has been drawn upon the analogy of the quarantine laws governing health officers. These laws stand in striking contrast with the whole body of constitutional laws, finding their only parallel in the acts permitted during actual war, and are constitutional only on the theory that human life transcends property interests. Even these quarantine laws are applicable only to contagious diseases liable to become epidemics, dangerous diseases such as tuberculosis. The attempt to condemn tubercular cattle in several states has finally been given up, except where the owners receive an indemnity. Where property alone, and not life, is at stake, any attempt to create laws permitting the destruction of private property without due process of law, and without suitable indemnity, would certainly not be held to be constitutional if the question came before the courts. With the proper county ordinances this whole question of constitutionalities could be eliminated.

The black peach aphis occurs in at least a score of localities in this state, and in most other states where peaches are grown, and nowhere outside of Los Angeles County is any serious attempt being made to eradicate the pest. It is by no means to be classed among the list of the insects of first importance. Among insects affecting the peach it stands about fourth, the peach tree borer, the San Jose scale and the peach worm being more injurious. The chief reason for attempting to eradicate it is the fact that as yet it is found in very few localities. If it were not eradicated within the next few years, eradication would become entirely hopeless, and the insect will be one of the factors to be considered in peach growing in this district. Nowhere else has the insect proven fatal to the industry, nor even unusually difficult to control, nevertheless the damage it is capable of doing is sufficient to justify considerable experimentation in the endeavor to eradicate it.

BLACK PEACH APHIS AGAIN.

By B. R. Jones.

Referring to the article by Mr. Essig in the last Cultivator in which he gives black peach aphis remedies used in the East and in California, I wish to commend it in this, that it may be of great assistance in localities where this much dreaded pest is threatening the orchard. Having had no little experience with this insect, I would like to call attention of Cultivator readers to some points in the

At a convention of delegates to a good roads convention held at Fresno recently the San Joaquin State Highway Association was formed.

article, as they might be misleading and cause some damage. Mr. Essig's methods of treatment are all directed towards control. He mentions no means by which it may be eradicated, and his last word is "It is never necessary to dig out trees in a generally infested district."

As to conditions in Los Angeles County, we have this pest owing to our lack of knowledge in the past regarding the insect. The shipment of nursery trees, the roots of which are infested, is one of the causes of its spread.

Mr. Essig mentions kerosene emulsion, whale-oil soap, tobacco decoctions and most of the other means of control, and I wish to say that the Los Angeles County Commission has used them "and then some." Trees were deluged until three-fourths the leaves were gone. We fumigated with hydrocyanic acid gas, single dose, double dose and triple dose, all in one season, yet within a week after treatment the few remaining leaves would again be covered with aphis. In conjunction with the above we filled the ground near the trees with tobacco juice, cyanide of potassium, distillate and carbon bisulphide. Still they came up the next spring on such trees as sur vived; or if they did, stone fruit trees set in the same places became infested.

I believe we used these remedies intelligently and we used them with persistence. Please observe, we were trying to eradicate, not to control. In this county there is no problem confronting us so serious, excepting possibly that of controlling the purple scale on citrus trees.

Some specimens of the aphis may be found on the tree tops at almost any time the winter through. In fact the only season when we were unable to find them was during the greatest heat of the summer. At that time they seek the cooler earth. If a whole neighborhood is infested, making eradication impracticable, they may be controlled as described by Mr. Essig, and crops of fruit raised. This presumes, of course, that the crop will be valuable enough to pay for this expensive treatment.

One orchard in which there was but one infested tree last year, this year had 52 trees infested, and I am doubtful if we found all at that. Next year it is probable the rest of the orchard will show infestation. We have a means of stamping out these plague spots, and we are applying it as fast as possible with regard to the interest of owners, who are, however, co-operating to a surprising degree. Our experience is that the only means of eradication is to inject carbon bisulphide about the roots of trees and spray with distillate, making both applications strong enough to kill trees as well as insects, and even then we advise planting no stone fruit trees on same ground for several years. Nurseries from all parts of the state are liable to stock new orchard ground by sending infested trees. We are making efforts to fumigate every deciduous tree shipped into the county. I believe every fruit growing community having stone fruit trees should organize an association for protection against aphis. This pest is a public nuisance and can only be handled by a thoroughly aroused people, and I hope that all in treating of the subject will appreciate the fact that in order to destroy the aphis it is necessary to destroy the tree as well. When it first appeared in Los Angeles County it was treated by the methods suggested by Mr. Essig which were advocated by Eastern authorities. If we had known what we know now, our county could have been free from it by destroying perhaps about fifty trees. Eradication will now require the destruction of probably fifty times that many, and the problem is becoming more serious daily. A carload of infested nursery trees was burned by the purchaser this spring on the discovery of the peach aphis on them. If any purchaser of infested nursery stock will notify the Los Angeles Horticultural Commission the trees will be cleaned or destroyed if necessary, and the Commissioner will see that he is not required to pay for such trees. — Horticultural Inspector for Los Angeles County.

THE WOOLY APHIS.

By Prof. A. J. Cook.

The wooly aphis of the apple, Schizoneura lanigera, is the most formidable apple insect pest of our region, if we except the codling moth. It is called wooly plant louse because of a dense white growth that makes it look like wool and covers the trees often as with snow. It not only has the usual forms of aphids, but there is also a root form that affects the roots as does the grape phylloxera the roots of the grape. This root form does the most harm, as it works the year around. Like the grape louse, it causes knots on the roots. It is easily found on the roots, as its white wool is very easily seen. About this season of the year, a little earlier, it comes forth, and covers the twigs often with a mass of white. Some of these on the twigs grow wings, and so can spread to other trees. Of course, the root forms may be carried as we plant affected stock from the nursery.

It is not necessary to destroy affected trees, as we have a good specific for these aphids. Those on the twigs may be killed by use of a strong solution of whale-oil or fish-oil soap. One pound of soap will make six or eight gallons of the solution. It should be sprayed on with force so as to reach all the insects. Tobacco decoction is the remedy for the root form of these lice. Tobacco dust from the cigar factories is cheapest. An easy way to apply is to basin about the tree, put in a pound of the tobacco, and cover. Then wet down, and the decoction will follow down the roots and kill the lice. Thorough work of this kind will prove effective, and never injures the trees.

It is well to dip young stock from the nurseries, in case the enemy is suspected, in the tobacco decoction.

CAUSES OF CHLOROSIS.

(Continued from Page 659.)

gation of this problem. We have only begun to get a few glimpses into the real nature of the factors which cause this undesirable and very harmful condition in our trees. It is hoped that present and future research will bring to light many more facts which will allow us to go to the eradication of the evil more systematically. However, I believe strongly that we should make use, in the most systematic manner, of the facts which we have at hand and not start out on an erroneous basis to fight an evil by erroneous methods built thereon.

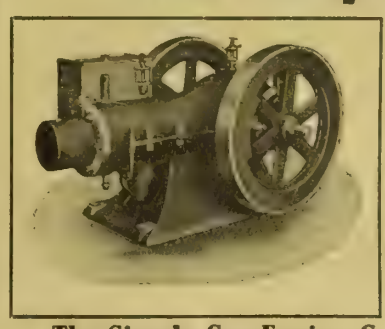
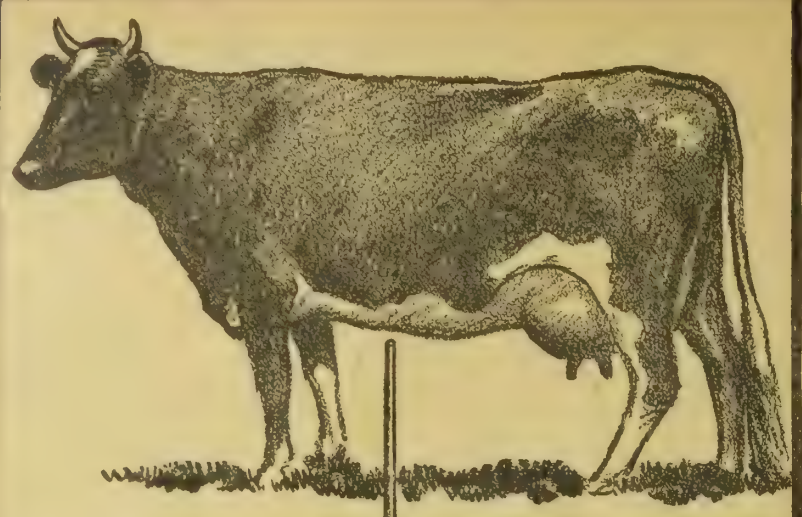
The Simple Gas Engine



NO Electricity, no plugs, sparks, and NO Carburetor; the greatest invention ever made on a gas engine. No other like it. Will operate on Distillate, Coal Oil or Gasoline. Cheapest in price, most economical to use; a child can run it. Send today for circular—it tells all about this wonderful ENGINE. Can be used for any purpose for which power is needed. Will run either right or left handed, and will run at any speed at which you set it. Two-cycle type. Send today for circular. This engine is years in advance of any other.

The Simple Gas Engine Co., 114 East 8th., Los Angeles, Cal.



That Cow

Is a great moneymaker

MR. HUDSON says:

Willows, Cal.

Sacramento Valley Irrigation Co.

Gentlemen: I am milking a small herd of common grade cows—part grade Jerseys and part grade Durhams, and my cream check amounts to $15 per head per month.

These cows are getting alfalfa pasture and wild oat hay. One of the cows will calve in a month—two were fresh in January and are two heifers under two years old in the lot.

I have farmed in Utah and am familiar with farming conditions throughout the West and know that dairy products can be produced cheaper here and a higher price secured for them than any place I have ever been.

I can keep dairy cows here for from three and a half dollars to four dollars a month the year around. It might cost a little more in the winter, but would run as low as $1.50 per month per head in the summer. A good dairyman can easily make $100 a head clear each year with grade cows. Yours sincerely

(Signed) ARTHUR HUDSON.

It doesn't take a large sum of money to own a dairy farm here. We make the terms most reasonable.

$15 DOWN THAT'S ALL

$11 A YEAR THAT'S EASY

You will have no trouble to sell the products of your dairy.

There is plenty of competition for all of the cream produced in the Sacramento Valley. There is a creamery at Jacinto, a creamery and cold storage at Willows, a creamery at Colusa and at Meridian, several at Woodland and at Sacramento, and all are bidders for cream at any point of the valley.

The skim milk and the manure from the dairy are products that are seldom rated at their full value. For raising poultry, hogs and calves, and for the maintaining and increasing the fertility of the land, and thus adding to the value of the investment, dairy by-products have a higher value every year.

Another strong argument in favor of dairying is that it forms a most satisfactory basis for diversified farming. With the monthly cream check as a foundation, and the chickens and hogs to consume the by-products, everything is turned to the best account.

Being able to harvest from six to nine crops of alfalfa a year you will realize that

"Twenty's Plenty—Forty's a Fortune"

You can purchase from 20 to 80 acres in this fertile district for $125 an acre, $15 down and the balance spread over 10 years. Write to-day for maps and printed matter.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

MILK—40 PER CENT FOR RETAILING.

The milk trade was investigated last summer in 78 representative cities throughout the country, and Payne says: "Taking the averages, it appears that the consumer paid eight cents a quart for his milk. The dairyman who produced the milk, with a large investment of capital in cows, land, buildings, and so on, got four cents a quart. The railroad got very little over half a cent a quart for hauling the milk to the city. The other three and a half cents were absorbed in distributing the milk from the city depot to the consumer."

A quotation from the government report of that invesitgation, in 78 cities: "The milk wagon of the retailer has a long route. It stops at a house or two in a city block, perhaps passes several blocks without stopping, and proceeds to serve customers thinly distributed along a route of miles. At the same time other retailers are covering various portions of the same route; and so there is a great waste of effort and of expense in the distribution."

Again, Payne writes: "Though the producer, on an average for the country, received half the price paid by the consumer, there were many instances in which he received considerably less than half. In all the cities of the north-central group of states, for example, the producer, on an average, received only forty-four per cent of the retail price—that is about three and a half cents a quart; the consumer paying eight cents and the freight being about half a cent. Evidently this was not a temporary condition either. Ten years ago the Industrial Commission took a great deal of testimony concerning the retail cost of distributing farm products. At that time the retail price of milk was generally six cents a quart instead of eight as at present. In Cleveland, to mention one strictly typical case, the producer received two and seventy-three one-hundredths cents for the milk and the freight was two cents a gallon. Thus the ratio between the consumer's price and the producer's price—the ratio, in other words, of the retail cost—worked out almost exactly the same as at present. In New York City at that time for bottled milk that cost the consumer eight cents a quart, the producer received two and a half cents and the railroad one cent, leaving four and a half cents as the cost of retail distribution.

It is very clear that no material change in the ratio of retail cost can be expected so long as the present system obtains. The producer, with much capital invested in animals, land and such things, will get about half the retail price. For hauling the milk to town, the railroad will get a fraction of a cent a quart. About half the total price will be absorbed in merely distributing the milk, the same day it arrives, from the city depot to the consumer's door."—Delivery.

GOVERNMENT PUBLICATIONS.

One of the great wastes of our government is the enormous free distribution of printed matter, mainly by the Department of Agriculture. Publications of other departments are distributed free, but, as a rule, only on application. Congressmen have been in the habit of distributing agriculture publications broadcast for no other purpose except to advertise themselves. The Congressional seed distribution is, of course, a national scandal. No other country does such things. Elsewhere all official publications are issued at a fixed price. Whoever wants them can get them by paying the price, and without the price nobody can get them unless it be public libraries and learned societies. This abuse is being restricted under the present administration, and the secretary of agriculture says that, in order to avoid wasteful distribution of printed matter, it has been necessary to limit more strictly the gratuitous distribution and to depend more largely on the sale of publications by the superintendent of documents at prices sufficient to cover the cost of printing. That official reports for the last year a greater sale of this department's publications than ever before. The total number of copies sold during the year was 117,218, and the amount received for these was $16,293, an average of about 14 cents per copy. The sales of a single publication, that popularly known as "The Horse Book," netted more than $1100. The sale of agricultural publications has trebled within three years. The most commendable feature of this system is the use of the money resulting from sales in reprinting publications to supply the demand. By this means a large number of valuable publications are made continually available. The superintendent of documents during the fiscal year reprinted fifty-five publications of this department, issuing a total of 44,354 copies."

THE GOVERNMENT'S MORGAN HORSE FARM.

The Bureau of Animal Industry of the United States Department of Agriculture has purchased practically all the Morgan horses owned by the Willowmoor Farms, Redmond, Wash., the proprietor, Mr. J. W. Clise, of Seattle, having concluded to discontinue the horse breeding feature of his farm. These animals are intended for the Department's Morgan Horse Farm at Middlebury, Vt., where breeding work is being carried on with the object of preserving and improving the Morgan breed.

It is believed that the department has made a very fortunate purchase in acquiring these horses. The mares carry the old-fashioned Morgan strains, and mares so bred have proved exceedingly valuable producers at the Morgan Horse Farm when bred to the stallion General Gates.

Some of the western Morgan strains have already been added to the Middlebury stud by the service of a number of mares to Meteor Morgan and Roy Morgan. This purchase increases the amount of "old-fashioned" Morgan blood and adds that of Indian Chief through his famous daughter, Lady de Jarnette.

This will give the Morgan Horse Farm about as many mares as can be conveniently handled, and further purchases are unlikely except as especially attractive opportunities may be offered to add unusually good animals which combine individual excellence with meritorious breeding.

NATIONAL DAIRY SHOW.

The sixth annual National Dairy Show will be held in Chicago Oct. 26-Nov. 4, 1911. The association has expended more than $200,000 in promoting the dairy industry of the United States and has more than met the expectations of the dairymen and manufacturers of dairy machinery and appliances in making higher and better standards in all that enters into the production and sale of dairy products.

The management believes the show this year in attendance will be second only to the International Live Stock Exposition. The plans are to make it one of the greatest and most beneficial to the industry it represents—an industry representing an output in the United States of almost a billion dollars.

It is evident that in Germany as in America the people have not yet been punished sufficiently hard, for their lack of good sense, to make any impression on them. The wise, shrewd dairy farmer, unless he has a silly woman for a wife, will stay on his farm and take advantage of the high prices for food these gregarious consumers must pay.

PROGRESS WITH MILCH GOATS.

By B. A. R. Stocker.

Referring to the fine article on Goat Dairying quoted in the Cultivator of May 4th, I find a record of the Toggenburg doe Fanette which appeared to be the best to date: in one day 9 lbs. 10 oz. of milk.

There is a mild, pathetic-looking little animal here in the back yard that has no idea she is anywhere near the top of the tree. Let me introduce Tassie, my half Toggenburg three-year-old doe bred by Mr. Forsyth of Pasadena. She brought twin kids March 3rd. Record began March 5th.

Tossie, a Five-Quart Doe, Three Years Old, Half Toggenburg.

I milk three times a day week days, and four times on Sunday, weighing the milk and recording it immediately. In two months she had given 540 lbs. 5 oz.; top notch for one day, April 16th, 5 quarts and 7 ounces. Now, ten weeks after kidding she gives up to nine and a half pints some days. She has the coloring and appearance of a pure Toggenburg and brings great thrifty kids.

This goat is not fed on barbed wire and takes no interest in tomato cans unless filled with good yellow corn. A favorite order of hers for lunch is "California pumpkins on the half shell." These are esteemed as an appetizer.

Tassie's yard-mate is a yearling, Nasula, a grand-daughter of Prince Bismarck, and my first four-quart Red Alpine doe Luta. Nasula already is bigger than Tassie, will be fresh in five weeks, and has a bag like a full-sized cocoanut at this early date. I fancy Tassie will have to put her best foot foremost to keep ahead of Nasula when she gets to going.

I have had two does that milked in their first period eleven and a half months, but only when they had been in my own care for all the months beforehand. I well believe that the limit is set both for time and quantity before ever the doe freshens, determined by the care and nourishment she receives in all that time. She may fall below this limit but cannot pass it that year. Experience seems to bear out the conviction that better records are going to be made in California than any that come to us from Europe.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles.

DAIRYING THE NEW WAY.

In considering present conditions in dairying, both on a large and small scale, it seems like a transition from the dingy past to a brighter clime, and sunnier, happier and more profitable methods, that bring more comfort and happiness in the rural home. Labor, in some ways, is present, but not the drudgery that marked the lives of the women in the olden time. A new era has dawned and dairying is carried on by the strictest business methods.

In the place of the old brindles, line back, mottled and red cows, are the black and white Holsteins, the yellow and white Guernseys, or the brown or fawn colored Jerseys. They are cared for with the kindest consideration. An abundance of feed is furnished in the form of pasture, supplemented with soiling crops during the summer, and the choicest clover hay, grain and silage in winter. The feed is not given in a haphazard way, hit or miss, but is balanced to meet the requirements of the system and bring a maximum yield of milk.

The barns are large and convenient, well lighted and ventilated so that the temperature can be controlled at all times. Perfect cleanliness is practiced in the stable, and no rank odors are allowed to remain. The clothing of the milkers is kept scrupulously clean, and only worn during the process of milking. The water is heated to an agreeable temperature for the cows; no chilling of the cows at watering time to retard the digesting process of the feed consumed.

On the smaller farms remote from shipping stations the milk is separated with the hand separator, the sweet milk fed to the calves and pigs, and the cream retained at the proper temperature until a "churning" has accumulated, then ripened, churned, worked, salted and packed in small jars and sold at a fancy price to private customers who are willing to pay a good price for a good article.

Those near the creameries, cheese factories and condenseries, deliver the milk each day to those plants, where it is worked up by skilled workmen in the fine arts of dairy products manufacture, the product sold by competent salesmen, a commission retained for the manufacture and sale of the goods, and the returns turned over to the dairymen by monthly checks.

The up-to-date dairyman does not work by guess. He has a record sheet in his stable, weighs his milk regularly, keeps a record of it and knows just what each and every cow is doing for him. By having his milk tested from each cow for butter fat, he knows the value of the milk given by each cow during the year. This plan enables him to weed out the unprofitable cows, and breed and keep only those that are paying a handsome profit. It is doing business in a business way.

* * * *

One of the difficulties that have confronted the dairymen has been the dislike of the boys for the business. It is too confining. The milking operation is distasteful for several reasons. They often remark they will be willing to follow in almost any other line of farming if they can be excused from the milking part of the work.

Some of the better class of dairymen, who are fathers of boys, are solving the problem. Instead of keeping the boys ignorant of the business they are encouraged to read books and papers that discuss dairy matters. The father talks over the different phases of the business with them. They are told of the profits that accrue, and of the stability of the business; the steady and constant income that makes farm life more agreeable than when the family have to wait for four or six months for a crop to mature, be gathered and sold.

Another thing that interests the boys is allowing them to attend the dairy meetings and hear able men dis-

This Is Why!

Putting the matter as briefly as possible, the reasons for the absolute superiority of the

United States Cream Separator

over all other Separators, are as follows:

The United States Separator employs a device for delivering the incoming whole milk back of the cream wall, thus preventing any possible remixing of the cream with the skimmilk. This device is patented by us, and can be used on no other Cream Separator.

The United States Separator employs a skimming device which by reason of its non-aligned channels, subjects the whole milk to a higher degree of centrifugal stress than any other skimming device. This, also, is our patent; it can be used on no other Cream Separator.

The United States Separator, by reason of its highly efficient skimming device, can be thoroughly washed and made sanitary (as the records show) in 10 seconds. Because the same principle is used in washing as in skimming.

The United States Separator is built to last a generation; and it does. Sixteen, seventeen and eighteen years of perfect work, is the record it has made.

The United States Separator, by reason of its modern and skillful construction, is now the easiest running Separator built.

Small Fruits and Vegetables

THIS MONTH.

By O. M. Morris.

The spring planting season is now nearing the close, as our summer months of June, July and August are among the most trying, for the general garden stuff, of the whole year. During the three months following, we must depend largely on crops already planted, except in a few items such as corn, beans, melons, carrots, beets, tomatoes, potatoes, cucumbers and squash, which may still be planted for succession. Lettuce,—especially Iceberg, will do fairly well if planted now, but succession plantings should be made frequently, say every 30 days, as it is more apt to "bolt" to seed during the hot weather, and by frequent plantings, fresh heads can be had when it is the most scarce, radish and turnips should also be handled in the same way, small plantings at frequent intervals. Onions can be planted now to some extent for either bunching or late dry onions, but it is necessary to have very moist soil—or kept well watered. There is no reason for being short on this vegetable, as it can be grown in California every month of the year, especially the green or bunching onion. From seed it takes only two and one-half to three months from planting to have good green onions or five to six months for dry ones, according to variety. The White Queen is probably the earliest to mature during this part of the year—and Australian Brown the best keeper—for general crop. The latter part of July plant the Bermudas, and on through till September, for winter crop. The Mammoth White Silver Skin is the best for "bunching," as it has a thicker neck and makes a longer and heavier set.

If you have not had success with early planted tomatoes, egg plant and peppers, it is not too late to plant now, either plants or seed, for at this season they grow exceedingly fast, and will produce later and bear heavier for late crop.

Corn can be planted any time this month and is frequently planted to follow barley crop after it is removed. But it is necessary to have ground well worked up and thoroughly wet. Pumpkins are frequently planted in same way.

Casaba melons are now being planted for winter or late fall, but ground should be plowed very deeply and thoroughly irrigated before planting and in most cases no further water will be necessary.

Potatoes should be planted during June and July for main fall and winter crop. Those planted during early spring will not keep through the long summer season, so this planting is by far the most important for winter supply. Burbanks are the principal variety used. Secure old or last winter's seed as far as possible, as new seed starts slowly, and not at all if not thoroughly cured and ripened. Also plant more seed of current season's crop than old or winter seed. Of current season we mean those planted early this winter and just coming off, which we might call new potatoes. Much disappointment has resulted from use of new potatoes as seed. But this can be largely overcome by thoroughly "ripening" seed by spreading out thinly in shade of trees or on barn floor for several weeks. Cutting two or three days before planting is also advisable. Treated in this way the potato is cured down and does not rot in the wet ground.

Right here we would also state all potatoes should be treated with formaldehyde to kill the scab disease, and we attach herewith a full description of the operation.

Potato Scab.

This wide spread disease affecting potatoes is due to the attack of a parasitic fungus, which causes the skin to become rough and scabby. This disease may be successfully combated by treating the planting stock with formaldehyde; 8 fluid ounces (1 pint) of this antiseptic is to be used in 15 gallons of water, which is sufficient to treat about 1000 pounds of potatoes. The potatoes should be cleaned from dirt, washed if necessary, then soak potatoes for 1½ hours in this diluted solution, after which they should be dried out and planted in the usual way, care being taken that treated potatoes do not again become infested by contaminated sacks or other receptacles. Formaldehyde, 50c pint.

Forage Plants.

Much inquiry is constantly coming in concerning crops to follow the hay crop for late feed. Probably millet is the heaviest hay crop that can be raised. By thoroughly filling the ground with water and sowing millet now one can get a good hay crop for late summer, or pasture for several months. Also for pasture sorghum or amber cane, kaffir or Egyptian corn, supply great quantities of green feed during the late summer and fall. But in most soils they require irrigation.

WANTED—PARCELS POST.

"The attorney general of Iowa has found out that one express company has made over 900 per cent on its investment in Iowa," says Successful Farming.

There is a great inducement for the express companies to fight parcels post. Our rate in the United States for carrying is far greater than the Canadian, and several times that of the German rate. Just think of it, Canada is as wide as the United States and more sparsely settled. Canada did charge one-half cent a pound for second-class matter, but finding this rate too high, cut it in half to the present rate of one-quarter cent a pound.

They had a surplus of $809,237.50 for the fiscal year ending in 1909. The United States postoffice has a deficiency. Why? They charge such a high rate for carrying packages that the express companies get all the short distance parcels and the postoffice department the long distance and unprofitable business. Packages by parcel post would come to our door, instead of us going to an express office to see if our goods had arrived. A package going from here to England is delivered cheaper by parcels post than at home.

Don't you want parcels post?

We can get it and must do so.

The writer has a scheme he is trying out and that is to have printed or written on all the letters and postal cards he sends out "Wanted—Parcels Post," on the outside upper left hand corner. When we wrote to seed houses or others for catalogues or on business, they mentioned in return "Your scheme is O. K."

"We surely want parcels post."

"If every person wanting parcels post would follow your request every time they do any corresponding there would be millions of precise commands for it."

"We note your request and will use the same method to get it."

Help us to make this idea contagious.

We know that the agricultural journals will copy this article.

Now let every one of us use this method all the time.

"Let me warn the inexperienced reader against running on flat tires," writes Lloyd Osborne in "Hints to the Motor Tourist" in Sunset Magazine for May. "No matter where a puncture overtakes you, move not an inch until you have installed a new tube or lock on your Stepney. Don't be tempted by a shady nook a hundred feet beyond. A hundred feet can cut your inner tube to ribbons, and injure your casing beyond repair. Let the sun beat down on your defenseless head, let the ground burn your unfortunate feet, let the spot be the worst you could have chosen in the whole state of California—but stay where you are. If you don't, you are a tire-murderer and unworthy to own a car. Never mind your wife's pleadings, but hustle out the jack and get busy. You will be rewarded, not only in the bright hereafter—but now."

The Ornamental Garden

THIS MONTH.

By O. M. Morris.

This is the month of least activity in planting in the flower garden. Most annuals are planted and many are in flower. Summer vacations are now nearing and many do not want the summer care of young seedlings. But we must remind you that this is just the season to plant most of the perennials and biennials, and by selecting a good place for seed beds one can plant now and young seedlings will not be ready to transplant till after summer vacations, and then at that time you will have all your plants ready for planting out. Any of these plants that require a long season to come into flower should be planted, such as coreopsis grandiflora, delphinium, pentstemons, digitalis, aquilegias rehmanias, anemones, gypsophilla, paniculata, hollyhocks, African daisy, hypericums, gazanias, salvias statice, verbenas, etc., also stocks and pansies are to be planted now for flowering in fall. The biennals should be planted now to get strong plants to bed out during fall, such as Canterbury bells, sweet Williams, francoas, etc. We would also advise early planting of cinerarias and primulas for winter flowering; these should be ready for transplanting in about two and one-half to three months if planted now.

One of the finest perennials of late introduction is the rehmania angulata from China; plants started last season are in full bloom now, and will last the better part of the year. It is a very decorative, large growing plant and flowers are produced in great abundance, and are valuable as a cut flower, large bignonia-like flowers in long spikes two to four feet high, and easily grown from seed.

Another wonderful and magnificent blooming plant is the new race of perennial hybrid delphinium (larkspur). In variety and beauty of its tints, which are as numerous as they are charming, no other plant can equal the delphinium. The brilliant flowers can be seen from a long distance and are strongly effective in beds or masses, in borders, shrubberies, or in combination with white lilies. Ordinarily the tall sorts are planted among the shrubbery as a background for dwarfs, which are favorite for bedding. Improvements are continually being made in the size of the flowers, as well as in the length and fullness of the spikes. Most of the species flower both early and late; the season for all can be prolonged by cutting away the withered flower-stems. They are sometimes increased by division but are more robust when grown from seed. All the varieties are very easily cultivated, and adaptable to many conditions, but in a soil deeply dug and well enriched with fine old manure their blooms are finest. They must have plenty of room to grow, one and one-half to two feet each way is not too much for the taller sorts.

The individual blossoms are of immense size, single, semi-double and perfectly double, dressing the graceful, towering spikes for two to five feet of their length. The colors and shades are wonderfully lovely and varied, ranging from pure white and most chaste lavender up through every conceivable shade of blue to deep indigo and purple, several shades being blended in some of the varieties. The plants are tall growers, from four to eight feet in height; there are but few plants that contribute so much to the beauty of garden or herbaceous border. By cutting off the spikes immediately after flowering these delphiniums may be had in bloom for several months.

BAUHINIA—MOUNTAIN EBONY.

By James Fullerton.

This is an extensive genus of plants, creepers and shrubs, widely diffused throughout the tropics, especially in South America and India. Many of them do well in the climate of Southern California. I have had experience with three varieties of these shrubs or small trees—the Bauhinia purpurea, galpinii and variegata. The purpurea is my favorite, with galpinii for second choice. The Florida nurseryman of whom I got my plants says of purpurea: "One of the finest flowering large shrubs we have ever seen. Flowers are borne in the greatest profusion, three to four inches across, varying in color from almost white to a rich purple and marked and shaded with many tones. We cannot adequately describe them; they are grand. The plant is robust and rather hardy, reaching a height of fifteen feet or more." This description does not do more than justice to the plant. With us it commences to bloom in April and continues to produce its orchid-like flowers throughout the summer. A plant in the plaza at Orange, just seven years old, is now in full bloom and is greatly admired.

The bauhinias would be a great acquisition to our parks and home places. The galpinii produces a wealth of beautiful orange-red flowers during the summer and autumn. The leaves of this plant are smaller and the shrub not so large as the purpurea. The leaves of nearly all of these plants are two-lobed and fold up at night. The plants are easily propagated from seeds, which are borne in beanlike pods, and if care if taken to prevent damping-off when small, will make rapid growth.

* * *

Through the courtesy of Mr. Eben Davis, Mr. Fullerton sent to this office branches showing flowers of the mountain ebony, which are exquisite in coloring and have a dainty perfume. Not only is the individual flower of great beauty, but the entire shrub is described as one mass of flowers. We appreciate Mr. Fullerton's calling attention to this desirable plant, and from our limited knowledge of it would say that it has promise of much pleasure for flower lovers of California. As this plant grows in a park of the city of Orange, it will no doubt flourish in a wide range of locations in California.

MEXICAN POPPY.

This plant, as its common name suggests, is a native of Mexico, and was given its generic name in honor of John Hunneman, an Englishman, a friend of botanists. It is in a class all by itself, its nearest relative is our true shrubby poppy, Dendromicon rigidum, which is also a monoty pic genus. To grow it successfully a perfectly drained bed must be provided for it. The soil if fertile will produce shrubby plants three to four feet high, which are coverd with its beautiful lemon colored flowers eight months of the year. They have the pleasing character of remaining open at night and during cloudy days, which a California poppy will not do. One reason why ninety per cent of the plantings of this desirable subject fail is the lack of thorough drainage. A bed four feet in diameter is large enough to accommodate a half dozen plants and they increase in size and beauty with age. If the subsoil of the garden is at all loamy or clayey, dig a hole at least four feet deep and fill it half full of broken bottles, bones or any other indestructible substance; over this place several inches of fine brush or straw, or weeds, solidly tramped down, to prevent the soil from immediately washing into the drainage. A ten-cent package of seed will furnish five times as many plants as are necessary to fill a bed four feet over. Like all the poppy family they are difficult to transplant, therefore it is wisdom on the part of the gardener to sow the seeds where the plants are to remain, thinning out to 12 or 15 inches apart. —Pacific Garden.

DWARF KAFFIR CORN for DRY LAND

No better fodder and grain crop can be planted on dry or alkali and than this prolific member of the Sorghum family. This dwarf variety possesses the advantages of more foliage, smaller stalk and ease of harvesting. Its great root system enables it to produce wonderfully in drought sections, and breaks up new ground for other crops.

FOR STOCK FEEDING

Dwarf Kaffir Corn will produce 10 to 15 tons of green fodder or silage to the acre, or 5 to 8 tons of dry fodder.

FOR POULTRY

The grain is a valuable food for poultry and will crop 2,000 pounds and upward per acre.

CONTENTS THIS WEEK

WOOL AND COTTON FOR THE WORLD, Cover.

PHYSICAL CONDITIONS OF SOIL, 659.

CITRUS AND TROPICAL FRUITS.—Nitrate of Soda Experiment; Importation of Bananas; Papaya in Hawaii; Government Phosphate Lands; 660, 661.

DECIDUOUS FRUIT CULTURE.—Black Peach Aphis; Black Peach Aphis Again; Wooly Aphis; 662, 663.

LIVE STOCK AND DAIRY.—Milk—Cost of Retailing; Government's Morgan House Farm; Government Publications; National Dairy Show; Progress with Milch Goats; Dairying the New Way; 664, 665.

SMALL FRUITS AND VEGETABLES.—This Month; Parcels Post; 666.

ORNAMENTAL GARDEN.—This Month; Bauhinia; Mountain Ebony; Mexican Poppy; 667.

EDITORIAL.—Control the Pests; Fumigation; Encouraging Agriculture; Take Pains; Editorial Notes; 668.

AGRICULTURAL NEWS NOTES OF The PACIFIC COAST.—Northern, Central, Southern, The Coast; 669.

PRACTICAL POULTRY CULTURE.—Canaries; What is Wrong with the Bantam; Poultry House Ventilation; 670, 671.

LEGAL QUERIES.—European Inheritance Tax; Leasing Without Authority; Renting from Agent; Patent Medicine; Public Road; Personal Property on Leased Land; Division of Property; Statute of Limitations; Line Between Properties; 672.

VETERINARY.—Eye Disease; Nasal Catarrh or Glanders: Cow Pox; Inflamed Hock; Lymphangitis; Breast Injured; Cough in Pigs; Bunch on Leg; 672, 674.

QUESTIONS AND ANSWERS.—Cementing Reservoir; Walnut Root Rot; Egg-Sucking Dog; Raisin Seed; Best Oranges; Thinning Fruit; Alligator Pears; Lady Birds; Cracking of Bark; Lizards in Apiary; Diarrhoea; Congestion of Liver; Tapeworms; Care of Young Orange Trees; 673, 674.

HOUSEHOLD.—Song of the Humble Bee; Thirty Pieces of Silver; Restoring Straw Matting; A Box of Candy; Housework Apron; 676, 677.

PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 678, 679.

CONTROL THE PESTS.

Doubtless our readers interested in deciduous orchards read with interest Mr. Essig's article in last week's Cultivator giving method of handling black peach aphis which is more or less of a pest all over the state. Inspired by that article Mr. Jones of the Los Angeles County Horticultural Commission comes in this week with some criticism of Mr. Essig's attitude, also commendation for some things he has said regarding the control of the aphis. Mr. Jones' idea is that control of this pest is not what is sought in Los Angeles County. Eradication is considered of enough benefit to the industry that the commission is determined that so far as one county is concerned the pest shall be eradicated. However, we note running through Mr. Jones' article statements which give one the belief that once established as widely as is the black peach aphis, it never will be eradicated. Mr. Jones maintains that the only way of eradicating it is to so treat the tree as to kill it, together with all aphis upon it and within the ground, but apparently his faith in this killing of the pest, even with the killing of the tree, is not strong, for we note he says: "Other stone fruits should not be planted on this ground for five years." Of course, this does not mean the making of a desert to wipe out the peach aphis, though an orchardist who has his all in peaches in a peach growing section and is fitted to handle the peach business, cannot look with pleasure on the prospect held up by Mr. Jones. Then at the expiration of the five years, many nurseries will be selling trees which may be infested with the black aphis, and again the same process is to be gone through with. Therefore we believe that the effort of the commission which looks toward the destruction of profit bearing orchards is unwise.

Prof. Woodworth of the State University says that this pest is in many sections of the state and it is in practically all sections of the East—still peaches are grown. The orchardists who are so enthusiastic over the destruction of the pest that they are willing to sacrifice their trees may be doing the wise thing, but if the trees are young and profit bearing, as we believe they may be with spraying at a reasonable cost, we believe we would preserve them.

FUMIGATION.

Some of the results of the work of Mr. R. S. Woglum, Special Agent of the Bureau of Entomology, in field investigations with hydrocyanic acid gas fumigation in California are now shown in three publications, Bulletin No. 90 of the Bureau of Entomology, Parts One, Two and Three. Part One is a report of Investigations, or more properly, a continuation of Bulletin 79, issued some months ago, and discusses the various details of fumigation procedure, while Part Two is devoted entirely to the value of sodium cyanide for fumigation purposes. Another circular, which is really Part Three of Bulletin 90, is by Mr. C. C. McDonnell and has to do with the chemistry of fumigation with hydrocyanic acid gas.

The main part of the bulletin takes up the history of fumigation and the recent renewal of interest in it, together with statements of the extent to which it is practiced in this state. The various systems of work are reviewed, likewise very condensed descriptions are given of the enemies for which fumigation is proving effective. Apparatus, including tents in various forms, canvas, gas proofing, mildew proofing, together with poles, derricks, hoisting machines, supply carts, measuring vessels, etc., are fully treated.

ENCOURAGING AGRICULTURE.

The Texas Industrial Congress with headquarters at Dallas, proposes to increase agricultural productions of that state by offering certain prizes for best productions of corn and cotton. Prizes will be for largest yield on ten acres, the first being $2500 in gold. Iowa also comes in with a $4000 premium for best oats grown within its borders. A supplementary $2000 premium is offered for production of other grains.

It appears to us that the annual appropriation made to the state fair of California might well be used along lines similar to these prize competitions in Texas and Iowa. For years we appropriated money for a so-called state fair which was nothing more nor less than a gambling bout; more recently an honest effort has been made for a legitimate fair, still it has taken on more of the features of a carnival of sports to the benefit of the city of Sacramento, but of very little to the state of California. The management has been changed this year and already action has been taken to sever connection with the freak amusement features. If this means a change of general plan looking toward an honest agricultural fair, then all honor to the management and all support to the effort.

Nearly every town in the state has its blossom carnival, rose festival, cherry day, water carnival or other local affair which brings in the people from surrounding localities and to a certain extent from all parts of the state. This is to the advantage of the community in direct return, and especially as an advertising feature. For Sacramento to have this benefit through state appropriations while other towns pay for their own is unjust. The new management should bend its energies toward holding a more general agricultural fair than has ever been done in the past. It may also be wise to consider the example of Iowa and Texas.

TAKE PAINS.

The winner of the first prize for the best raisin bread explains the reason for her success, "My bread is good because I take pains." Commenting on this statement the Fresno Republican gives a fund of wisdom on the matter of taking pains: "Just try it, in anything. Fry eggs, and 'take pains,' and see how different they are from the same eggs, fried in the same way, without taking pains. Put your dishes on the table, 'taking pains' and see how appetizing that table looks, compared to the same table, with the same dishes in the same arrangement, set without taking pains. When you are wrapping goods in a store, really care whether they are wrapped right or not and see how soon you are promoted out of the wrapping job. The good bookkeeper is primarily the one who cares whether his books are right or wrong. The artisan who 'takes pains' is soon foreman, and perhaps afterwards superintendent or manager. In business, in professions, in art, in literature, and in the common routine of common life, success attends the one who 'takes pains,' and cares."

While this is here applied to housekeeping, or professional life, the general principle holds for milking the cow, taking care of the hens, cultivating the orchard, or any other duty that may be ours. It is good, wholesome stuff.

The right of the government to control grazing in national forests has been maintained by a decision handed down by the Supreme Court. The question was brought up by the claim of certain states that the government could not control even its own lands within their boundaries. Secretary Wilson is reported as having said: "I am very sure that the stockmen of the West, as well as the western people generally, will accept this decision of the Supreme Court at its full worth and that the controversy which has heretofore existed regarding the right to use the grazing lands within the various national forests without permit from the Department of Agriculture will be brought to an end."

Manager Dargitz of the California Almond Growers Exchange reports promise for prices of almonds this season as of the very best. He says that the buyers are finding it difficult to secure stock even at 15 cents. A few contracts have been closed at that price. This looks different to the almond growers than before the organization of this exchange. Co-operation has not always succeeded, but handled with integrity and good sense there is a reasonable show for success, as is proven by the thousands of dollars which have been turned over to the growers and which they would not have received had it not been for co-operation.

If there is one part of the year in which it is better to kill weeds than another, it is right now. In fact, we could use this sentence in every issue of the Cultivator for the next 52 weeks—always the best time to kill a weed is "right now," but if there should be any preference it is for the beginning of the warm weather. The draft upon the soil for its moisture is wonderful. Wind and sun are worst of thieves, and added to them the hungry weeds evaporate tons of moisture, and only the very wealthy can afford them. Never let a weed get much above the surface of the soil.

At one time San Jose made an effort to be considered the "Spotless Town" of the Pacific Coast. Doubtless the effort still obtains. We hope so and that she will make good. Still more we hope her effort will stimulate every other town in the state to emulation, and not only every other town, but every country community. It adds to the worth of every community to be beautiful and the best part of it is that it is within the possibilities to clean up roadsides and plant trees and shrubs so that even in the absence of many natural beauties the locality may be made attractive.

An Eastern Exchange says: "The men who live out in the open, who hold communion with the running brooks and the trees and the everlasting stars, lose a great deal, no doubt, of all that is to be heard and seen in cities; but they do not seem to miss it very much. Nature has shown them long ago that in her rich and secret treasuries she holds things more precious than the toys and baubles of Vanity Fair that are for sale in the cities. She has, in the first place, taught them that there are certain simple elemental things worth more than all the luxuries together."

A letter from Mr. Ernst A. Bessey of the Bureau of Plant Industry informs us that a bulletin of which he is the author on the subject of "Root-Knot and Its Control" is now in type and will be soon issued. This is one of the most perplexing troubles affecting fruit trees and while we question any royal road to its eradication, we trust Mr. Bessey's bulletin will be helpful.

Agricultural News Notes of the Pacific Coast

Northern California

Winters reports alfalfa cuttings as showing exceptionally heavy yield.

A reclamation district has been formed near Tudor, Sutter County.

The Corning Poultry Association is already planning for its November show.

Lutheran colonists have purchased 30,000 acres in Tehama County and will colonize.

Members of Antelope Grange, at Roseville, recently held a successful annual picnic.

Vegetable growing has become an important factor with farmers of Portola, Plumas County.

Sacramento capitalists have purchased 320 acres in Eldorado County, which will be planted to apples.

Large dredges are throwing up immense levees which will reclaim 11,000 acres in Yolo tule basin, west of Sacramento.

Haying began at Meridian, Shasta County, on May 20, crops turning out well, though not as heavy as anticipated earlier.

Less than two weeks ago portions of Lassen County were visited by sharp frosts; slight damage to fruit was reported.

Prospects in the San Joaquin Valley are excellent for both wheat and barley, though crops will not be so large as some years.

Thomas Armstrong, an expert landscape gardener, has been appointed gardener in charge at the capitol grounds at Sacramento.

A reservoir covering 1540 acres will be built near Millville, Mendocino County, and in connection with it will be a tunnel 6000 feet long.

The Pomona Grange of Sonoma County met on the 13th at the home of one of the members and an excellent picnic lunch was served.

Orland, Glenn County, is planning for a jubilee celebration to be held June 16 and 17 in honor of the completion of her reclamation project.

The highest price ever paid for California cherries is reported from New York, a ten-pound box having commanded $195. They were Purple Guignes.

A nurseryman at Dixon, Solano County, has booked an order for 2,500,000 trees to be delivered within the next five years. The deal calls for the payment of $125,000.

The annual migration of cattle to the mountain ranges in the northern part of the state has been delayed for about a month on account of the deep snow that still remains in the Sierra.

A contract filed in Sonoma County calls for the delivery of 40,000 pounds of 1911, 1912 and 1913 hops at 16 and 13 cents. Another contract calls for a 17 cent price on 35,000 pounds of 1911 crop.

The Maywood Packing Company, composed of fruit growers, has just closed a successful year and declared a 10 per cent dividend. Directors for the coming year are: John Cockcroft, R. McEwen, D. H. Adkins, B. H. Brubaker and Walter C. Smith. F. G. Beresford was re-elected as manager, and J. B. Merritt was made secretary.

Central California

Some contracts for new crop raisins have been signed at five cents.

Fresno County reports peaches showing considerable pit split.

The Valley will probably produce about two-thirds of normal peach crop.

San Jose cherry growers have received eight cents per pound for some early whites.

Centerville, near Sanger, Fresno County, is becoming quite a citrus nursery tree center.

Fresno has an 812-acre sewer farm which gives a net income to the city over all cost of maintenance.

A packers' circular to the eastern trade makes a quotation of 8¼ cents on extra fancy seeded raisins.

Fresno has 200 acres of its sewer farm sown to barley and 160 acres to alfalfa. The grain hay will aggregate this season 425 tons.

The latest estimate as to the grape output of Fresno County is that the frosts of early April have left at least 50 per cent of a crop.

The deciduous orchard owners, members of the San Jose Grange, are holding for bigger prices than have yet been offered for dried fruits for the coming season.

Experts representing eastern capitalists are looking over the San Joaquin Valley to determine as to the prospects for a vegetable pickling factory and cannery.

Orchardists of the valley are pleased at the results following the repeal of the fence law which permitted stock owners to graze over a man's land without payment of any damages unless the land was fenced.

The raisin day publicity committee recently met at Fresno and discussed plans for advertising raisins over the East for the coming summer. The plan will first be to advertise in grocers' publications.

Papers all over the state are asserting that San Jose Grange has fixed upon $90 per green ton for apricots. Either the papers are all copying the same typographical error or San Jose Grangers are stiff on prices.

Horticultural Commissioner Hickman of Monterey County recommends for the eradication of Johnson grass the plowing of land the latter part of May, again the latter part of June and again in August. This is promised to practically wipe out the pest.

The Merchants Carnival and Products Exposition at Merced last week called forth great crowds from Merced and surrounding counties. Most striking were the produce exhibits. The Merced Poultry Association and the live stock interests of the county made fine exhibits.

The Fresno Chamber of Commerce is agitating the question of an investigation of Zante currants and urging the Department to give justice to California raisin growers. The "currant" is nothing more nor less than a raisin and should not be imported under the name of currant. But the strongest fight against this stuff is based on the claim that it is prepared in a most unsanitary and unclean way; samples have been received in this country which are partly decomposed.

Southern California

Coachella Valley has finished the shipping of her Bermuda onion crop.

Pomona is to have a clean-up day and roadsides and parkways are to be beautified.

Ventura County bean growers still have on hand about 5000 sacks of last year's crop.

Orange County dried fruit growers are looking for at least a 15 cent price on apricots.

The first of the Imperial Valley's 2000 cars of cantaloupes are now going to market rapidly.

An expert of the Department of Agriculture is investigating the thrips situation at Riverside.

Prof. C. M. Haring of the State University is investigating live stock conditions in the Imperial.

The last meeting of the Covina Valley Farmers Club was under the wal nut trees in an informal picnic.

Apricot growers at Elsinore, Riverside County, contemplate the formation of a dried fruit association.

Brawley will celebrate the independence of the country by a Cantaloupe Day preceding the regular celebration.

The Anaheim Orange Growers Association has shipped 240 cars of Navels and will ship about 100 of Valencias.

The Oxnard Lima Bean Growers Association has issued a booklet of facts about lima beans which contains recipes.

Some sections of Southern California were visited by a shower last week, Pomona receiving over an inch and a third.

Santiago Orange Growers Association has leased the McPherson packing house at Orange which is one of the oldest in Orange County.

The bee keepers of Hemet, Riverside County, have formed an association for the marketing of their coming output; the crop will be large this season.

San Bernardino County apiarists estimate a shortage of the honey crop; the bees have been dying at a rapid rate; some apiarists report 75 per cent loss.

A demonstration of "farming with dynamite" was made by representatives of a powder concern at the state citrus experiment station at Riverside last week.

Riverside hay and grain crop will be shorter this year than last; the early sown grain is not as good as the late. The estimate is that the hay crop will not exceed 50 per cent of average.

State Commissioner of Horticulture Jeffrey following the instructions of the San Bernardino Convention, has appointed the following committee on the standardization of citrus fruits: E. J. Yoakam, Highland; J. M. Randall, Whittier; E. F. Van Luven, Colton; Fred J. Smith, Pomona; Kenneth McRae, Rialto; V. V. Leroy, Claremont; Fred M. Reed, Riverside; R. P. Cundiff, Riverside; S. A. Pease, San Bernardino; Francis Cuttle, Riverside; E. O. Kennard, Glendora; James Barnhill, Colton; Charles R. Paine, Redlands; William C. Fuller, Colton; Harry B. Chase, Riverside.

The Coast

Milton, Oregon, shipped its first strawberries May 15.

Arizona will produce 9,000,000 pounds of wool this year.

Buckeye, Salt River, Arizona, will plant largely to sugar beets.

Plans are perfecting for irrigating 2,000 acres near Salome, Arizona.

Denver proposes to make itself the best shaded city in the United States.

Hog raising is being extended in the Inland Empire of Eastern Washington.

The wool scouring mill at Echo, Oregon, has started on its season's run.

A co-operative fruit marketing association has been formed at Le Grand, Oregon.

Farmers of Lane County, Oregon, are forming an independent telephone company.

The Spokane County Farmers Union held its last meeting at Medical Lake last Saturday.

The Colorado state senate has approved the appropriation of $10,000,000 for good roads.

The Yakima Valley fruit growers are conferring with the California Fruit Exchange.

Salt River Valley stockmen recently sent out a twenty-eight-car train of splendid fat steers.

Nogales, Arizona, reports receipt of 12,000 to 15,000 head of cattle monthly from Mexico.

Eastern capitalists have purchased 32,000 acres adjacent to Prescott, Arizona, and will colonize.

Argentina, South America, promises to compete with California in supplying grapes and oranges.

Portions of the Philippine Islands are interested in a new method of extracting oil from Para rubber seed.

The Farmers Union of Wallowa, Baker and Umatilla Counties, Oregon, will hold a three-day picnic next week.

The wool market at Portland, Oregon, is not satisfactory to the growers, ten to fourteen cents being prevailing price.

Washington claims an output of $4,500,000 worth of apples last year, and this year the output will exceed $500,000,000.

At a recent sale at the Union Stock Yards, Portland, Oregon, 750 head of yearlings brought $5.10, and a bunch of fine lambs sold at $7.

The Alberta government has granted $10,000 to meet the expense of the dry farming congress if it is held at Lethbridge in 1912.

Watermelon growers of the Salt River Valley have secured a lower freight rate to Denver. Over 400 acres have been planted in the valley this season.

Crop conditions of Walla Walla Valley, Washington, were never better, and the one valley will turn out this year well up towards 10,000,000 bushels of wheat.

Many Wyoming sheep have died within the last few months from eating poisonous weeds growing on the ranges. The experiment station and Department of Agriculture are combining to investigate.

BUY BABY CHICKS NOW--Special Prices.

We have 5000 per day of most all standard varieties of chicks. Right now we are making special prices on chicks in lots of 100 or more. Send today and state what kind of chicks you wish, and we will be glad to quote the price. We sell hatching eggs of all standard kinds, also cocks, cockerels, and laying hens and pullets.

Write us your wants today. Largest Baby Chick Dealers in the world. We handled 23,000 baby chicks in one day. That's the largest hatch ever made in one day in California. Get the free 64-page catalog; send today. The world's largest chick dealers.

PIONEER HATCHERY
108-118 East Eighth Street, Los Angeles, Cal.

This open front door makes perfect ventilation

Mandy Lee is Miles Ahead

It is the only Incubator without a "Sealed," Air-tight Egg Chamber. It supplies the life-giving oxygen freely, draws off the carbonic acid gas, and is saving the lives of millions of chicks.

READ the story of the Mandy Lee triumph in our new catalog. Other incubators are already preparing to imitate and profit by our great discovery.

No guessing with a Mandy Lee

You cannot afford to buy an old-theory incubator which may go out of date and be discarded next year. You should know the truth *now* about the great discovery. The book is free. Ask for it.

There IS Something New in Incubators

We have taken the boldest and most important step ever taken in incubator building. See the openings into the egg chamber? They mean the saving of chicks' lives. It is the key to *right* hatching. Ventilation in the Mandy Lee is now perfect. It goes on all the time, neither above nor below, but right *at the eggs.* Every minute of the hatch the life-giving oxygen is freely passing in to the eggs and the carbonic-acid gas is passing out. And correct ventilation is just one of the great Mandy Lee features.

We Don't Guess—We Measure

The Mandy Lee is as far in advance of other incubators in heat and moisture as it is in ventilation. We do not guess at anything. The sensitive regulator controls heat to the fraction of a degree and *we measure moisture* just as accurately with the Mandy Lee Hygrometer (one sent with every incubator). You know what you are doing. *You* measure and control moisture; *you* control the hatch. The Mandy Lee is the all-season, all climate, all condition hatcher, always producing the most and the strongest chicks.

NEW OUTDOOR BROODER
Heated—Storm-proof

Mandy Lee Brooders give direct contact heat to the backs of the chicks. That is *real* mothering, the most important thing in poultry. Hovers are raised and lowered as weather gets warmer or cooler—heated from end to end. Chicks do not pile up and smother. Write to-day for catalog and full information.

Practical Poultry Culture

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will convey a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

MORE ABOUT CANARIES.

By Mrs. A. Basley.

As a lover of canaries and a successful breeder of them all my life, I am always glad to learn more about them and encourage our readers who may have the same tastes. I have asked a canary expert breeder and judge to tell us more about the different breeds of canaries that are popular in England and in Europe.

The judge (John Burrows) was for a number of years secretary of the Leicestershire (England) Ornithological Society and of the celebrated Leicester Shows, and knows more about the English canaries and English wild and cage birds than any one I have met in California. His description of high-class canaries will interest many.

The largest canary is the Lancashire "Coppy." This we place first because it is the giant of the canary family, often measuring seven and a half to eight inches long. As their name implies they are bred for their crests, "coppy" being the old English for crest or cap. A good exhibition bird should have a drooping crest with a well defined center, the crest feathers entirely covering the eyes and beaks.

Yorkshires. These birds are sometimes called the "Aristocrats" of canarydom. They are very straight, long and slim, with an erect carriage and feathers like wax lying tightly to their slim bodies.

Lizards. A bantam variety of the canaries with beautiful spangled coats and a clear (not spangled) cap, the yellows are called the Gold Lizards and the Silver Spangled have the tips of the yellow feathers just slightly tipped with white. They are both most charming little, tiny birds.

Borders. These are another of the Wee Gems. They should be round in shape and as tight in feather for exhibition as though carved from box wood.

Cinnamons. A beautiful variety of the Norwich type is called Cinnamon. They should be of sound cinnamon color with dark penciling showing on their coats. This is a truly grand variety.

Scotch Fancy. The Scotch Fancy is a great favorite in Scotland. They should stand with the head over the perch and the tail under, forming a crescent like a new moon.

Belgium. This variety should stand on the perch with the tail in a perfectly straight line with the back, head bent down so that the shoulders are the highest point on view. They are trained to keep the head down and the shoulders up, so that they have almost the appearance of being hump-backed.

Dutch Frills. These are frilled on the chest which makes them appear rough, but they have many admirers.

London Fancy. This once popular bird with clear, bright yellow body and dark wings and tail seems to be getting quite scarce, now very few being bred, probably on account of the difficulty of breeding with the proper markings.

Rollers. These are common birds, but are bred and trained to sing. They can be taught the song of any bird but to be kept perfect they require to be retrained at least every two years, or their song reverts to the natural song of the canary tribe. They were first trained in the mountain districts of Central Europe, especially in the Hartz mountains, but are now extensively bred in England, the "Home" of the canary. The English "Roller" nearly always comes out first in the singing competitions. Though the Rollers have nothing to show in the way of beautiful plumage they make up for this by their wonderful singing. None of the best singers are put on the market; they are kept to train the next year's birds and are called "schoolmasters."

Norwich. Last but not least, we have the Norwich variety. This is without doubt the most popular and beautiful of the canary family not only on account of the lovely and wonderful coloring but also as singers they are second to none. In no other variety is there such depth of color, and so large a variety of markings.

The Norwich canary should have a full round head with thick short neck set on a chubby round body, broad chest, short wings and tail. He should stand well across the perch with a bold jaunty appearance. They vary in coloring and feather through all the various phases of marking from the green to the clear yellow, sometimes a specimen is seen with both eyes and wings marked alike, these are called "even marked" and are highly valued, while rarer still is the bird marked on eyes, wings and each side of the tail, this is called a "six-pointed" bird.

The Norwich is divided, as are the other varieties into "yellows" and "buffs." Good exhibition specimens of yellows are of the brightest orange, almost the color of red hot iron. The "buffs," although as deep and bright in color, have the end of each little feather just tipped with white very lightly. The deep bright yellow shining through gives the appearance of being frosted, or as if a thin white lace veil were over the bird with the yellow shining through. The effect is almost indescribably beautiful. Some of these birds are extremely valuable. They are good songsters, exquisite little birds, bright and intelligent.

There are many shows in the different cities and towns all over England, Scotland, Wales and Ireland in the fall and winter and when these shows are over the owners of the prize winners send the champions (those that have never been beaten) up to the biggest and best show of all in the month of February at the Crystal Palace. At the 52nd annual show last February there were in all 2600 cage birds competing for prizes. A prize there means a winning over about 26,000 birds from all over the country.

WHAT IS WRONG WITH THE BANTAM?

Why is it that more people do not raise bantams? Are they the little good-for-nothing, infernal nuisances that some people claim they are? In answer to this I will say no. The bantam fowl are today being sadly neglected, simply because some people are afraid to invest a few dollars in a pair of these little beauties and thereby convince themselves. Do not let your neighbor or friend do the deciding, but do so yourself. If you think that you would like to purchase a few bantams, do so; but do not go to your neighbor or friend and ask his or her opinion, and thereby lose heart when informed by him or her that bantams are only an expense, for in this assertion they are mistaken, as bantams not alone afford one much amusement, but in some cases produce as much profit as their larger brothers and sisters.

First of all, if you intend to buy a few bantams you may as well purchase well-bred ones, and these you can secure by buying from some reliable bantam breeder. A nice pair of bantams should cost you at least $5, although they can be bought much cheaper than this from some extensive raisers. There are many varieties of bantams, namely, Cochins, Games, Japanese, Sebrights and Polish. Pick out the kind you most admire, but if you are looking for a well-built fowl and one that is a great layer, do not overlook the Game. For beauty, the Polish and Cochins rank high. Now that you are going to buy some bantams, why not get to work during your spare minutes, or while you are awaiting their arrival, and build a nice coop for them? Many people secure a piano box, which they then tar-paper, but the best plan is to build a coop about six feet long, four feet wide and four feet high. In these dimensions you have a very nice coop for a pair or trio of bantams, and after your flock begins to grow, this same coop will easily accommodate from six to eight bantams. See that the coop has a good board floor, over which throw about one inch of dirt, and over this dirt about one inch of straw. Your roof should be tar-papered—in fact, it would be a good idea to tar-paper the entire outside of the coop, which will make same perfectly dry. Be sure and have your coop well ventilated, and see that your fowl have plenty of light, as these are two important essentials of any successful poultry fancier. Do not be afraid to give your coop a good whitewashing before placing your fowls in same, and after they have occupied the coop for a while give it one or two coats of whitewash regularly every month. It is always best to add a small quantity of carbolic acid to a bucket of whitewash, as this prevents mites from entering, and is also a good purifier. Have a good dropboard under your roost, and under this dropboard have your nests. Have a nice wire run at one end of your coop, and it is a wise thing to plant a few currant bushes here and there in the run, as they provide shade for your chickens during the warm summer. For a feed use a mixture of millet, corn, wheat, charcoal, grit, etc., which can be purchased at almost any feed store. Bantams thrive better on a dry feed, although it does not hurt to give them a mash of cornmeal or bran once a week, especially in the winter time. Always have a handful of crushed oyster shells around, as bantam hens need grit just the same as larger hens in order to produce eggs. Your bantam hens will soon be laying, and your eggs should be worth from five to ten cents each. What eggs you do not sell, set under one of your hens, as bantam hens make excellent mothers, and some Game bantam hens set three times in one year. The birds you raise can be sold at from $1 up, according to the way they mature. Some will be better shaped than others, and these are the ones which will bring the most. Many people who at one time despised the bantam, after having them one year would not part with the ones they raised during the year for any money, as they become so infatuated with their little pets that they hate to part with them, but I would advise you to sell a few pair, provided you have had good results, the first year. After having picked out the ones you intend to keep for breeding with next year, pick out a few or all of these birds that appear to be good in shape and color and enter them in a few poultry shows. All you can do is to lose, and this will not be so much, but if you have taken the proper care of your chickens during the year and have not been fooled in your stock, you will certainly get a few prizes and enough money to pay for the cost of entering them. After the show is over, add up your total expenditures for the year and then add up your total receipts, and if you have done as I advised you certainly will be a gainer. If you have suffered a loss, which cannot be very much, there is something wrong. Do not get discouraged, but go into it next year deeper than ever. You will know more about your chickens, and will have a system to work on which you have learned during the first year. If your stock is not what you think it should be, purchase a good cockerel from some reliable bantam dealer, as you did your eggs, and use him for breeding purposes during the second year, which will build up your stock. —American Poultry Journal.

POULTRY HOUSE VENTILATION.

A system of ventilation which admits pure air through the bottom of the poultry house is entirely wrong. Pure air should be admitted through the ceiling and the foul air should be drawn out near the floor. This will insure an even temperature with no drafts.

It has been demonstrated that the best way to ventilate a poultry house is through the doors and windows. If there are two windows in the pen, remove the sash from one window, or either the upper sash from each of the windows, and in its place make a frame to fit snugly. Over this frame stretch tightly burlap or any heavy cloth of light color which will admit the air and light but will prevent any drafts. On warm days have the door open during the middle of the day. Leave the burlap screen in the window both day and night. Have a warm roosting closet and provide a curtain over the front of it which can be let down on cold nights. The heat of the bodies from the fowls at night will keep them comfortably warm on the coldest nights.—Ex.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

European Inheritance Tax.

I am a native of a European country and have been a citizen of the United States for a good many years. Some 20 years ago I got some money out of my father's estate and after his death a year ago I got some more. Now I am informed from that country that I have to pay a kind of inheritance tax of the whole amount. Please let me know in California Cultivator if I am compelled to pay that.—Subscriber.

I do not see how it would be possible for the authorities in a European country to enforce such a claim in this country; if possible, it would hardly be practicable unless the deduction for the tax was made before the money was sent to the heir.—E. L. D.

Leasing Without Authority.

A has been in possession of a farm for six years. B rents part of it on shares in 1909. In the year 1910 B rents it for cash paid in advance; in 1911 B again rents it on the same terms. Now C writes to B and says he owns the land, that he never gave A authority to rent or lease the land, and asks B to vacate the land at once. Has B to vacate before his lease expires? Can a renter remove barbed wire fences he has built or a wind mill he has erected before his lease expires?—Subscriber.

If A had no authority to rent the land to B, and C did not ratify the lease to B, B has no rights that he can enforce against C, and can be dispossessed of the land in an ejectment suit by C.

A barb-wire fence, if it consists of poles sunk in the ground with wire strung thereon, would belong to the land, and should not be removed. The windmill would come under the same rule, if attached to the soil.—E. L. P.

The query is an example of not stating the case clearly enough. If "A has been in possession" means that A actually owned the land, then we doubt not Mr. Payne would agree that regularly executed lease would hold in spite of any subsequent purchaser from A. But apparently A was occupying the land by permission of another tenant. In that case B's only recourse is to secure justice from A.—Ed. C. C.

Renting from Agent.

A, a non-resident, owns a piece of land in alfalfa. He writes to B a real estate man, giving him full authority to lease the land and handle for him. C leases the land from B in 1910 for half the crop. In the winter B writes C to take land another year, that is this season, but no regular form of lease is made out. C cuts the first crop and irrigates. Then A through B sells the land to another party. B then notifies C that he cannot have the land anymore because the new owner desires it. Is the letter from B to C, telling C to take the land for the 1911 season as good as a lease? What rights has C and what course should he take in case the new owner has another party handle the alfalfa?—C. E. N., Crows Landing.

If the purchaser of the land had no notice of the lease, and purchased with a right to immediate possession, or possession before the lease expired, the lessee has no rights that he can enforce as against the purchaser, but has a cause of action for damages against the former owner, that is, provided the authority of B to lease to C can be established, either by previous agreement with A, or by subsequent ratification of the transaction by A. C's right of action is against A for damages for breach of the lease. E. L. P.

Patent Medicine.

Would a person having a patent on a medicine for specified ills have recourse on another who would discover that same medicine was beneficial for another widely different ailment, who would purchase said medicine on the market, rename, relabel and rebottle and sell for said different disease.—Subscriber.

Patent law is a specialty, and I never have had occasion to familiarize myself with it. I would suggest that you consult some good patent attorneys.—E. L. P.

The Cultivator likes to be generally helpful but trusts the queries sent in shall be of general interest to the farming or fruit-growing class. This query isn't in that class and is only given as an example of what we don't want. The Cultivator isn't in the patent medicine class.—Ed. C. C.

Public Road.

Four parties own land, all joining on a half section line, three of the parties are willing to give half of a road on said half section line, but one objects. What steps should we take to force a road through and to get the county to take charge of it.—Subscriber, Parlier, Fresno Co.

The proper procedure is to petition the board of supervisors of your county to open the road, getting upon your petition the names of all of the property owners through whose land the road would pass, except, of course, the one who objects, and you should also consult your county engineer, as you will be obliged to present a map with your petition showing proposed route of the road, its dimensions and terminal points, which map will have to be approved by your county engineer. In all probability, the clerk of your board of supervisors can furnish you blank forms of petition, and with information, to better advantage, concerning the project, than I can in the limited space here at my disposal.

Personal Property on Leased Land.

In renting a ranch we got a lease on it, but it does not state that we can move the improvements. Have building on runners. Can land owner claim them at end of lease? How would we proceed? Have a new lease made out?—Subscriber.

Buildings on runners which are not so large but what they can be easily drawn off the land, would probably be regarded as personal property, and not as fixtures, and would belong to the lessee. In your new lease it would be advisable to cover the matter by inserting a clause giving you permission to remove any and all buildings erected or placed on the property.

Division of Property.

I have an agreement to buy twenty acres of land for the sum of $1500. Part of this I have paid, and I have until 1914 to pay all. This agreement is not recorded, but is signed and (witnessed signed). Now I have parents, sisters, brothers and husband. In case of my death, without a will who of these would come heir to this property which is in California. In case I had a child how would it be divided and to whom?—Subscriber.

Where the decedent leaves no issue the estate goes one-half to the surviving husband or wife, and the other one-half to the decedents' father and mother, in equal shares, and if either is dead the whole of said half goes to the other. If the deceased leaves a surviving husband and only one child, the estate goes in equal shares to the husband and child. These are the provisions of the law applicable in case the party dies without a will.—E. L. P.

Statute of Limitations.

An osteopath guaranteed to cure or greatly benefit a deformed child five years ago in Oregon. The treatment did no good whatever. Can she now sue and collect the bill, or is the debt outlawed? If it is not outlawed can property be attached and held for payment? It is not a just debt.—C. T., San Fernando.

Such a claim outlaws in six years in Oregon, but the time that you have been out of the state of Oregon would be deducted and while you are out of the state of Oregon the statute of limitations does not run. Property can be attached on such a debt. You should set up your defense if an action is brought against you, and perhaps you would be successful in proving your side of the case.—E. L. P.

Line Between Properties.

The line between my forty acres of land and my neighbor has been established and recognized by both of us for nearly six years of my ownership and I am told, for many years previous by the former owners. A new owner of the adjoining land has the lines resurveyed changing the lines somewhat. Does the old survey or the new one hold?—L. J. P., Orloff.

The old line having been acquiesced in and recognized as the proper line for more than five years, has become the boundary.—E. L. P.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Eye Disease (Enzootic Ophthalmia)

I would like to know what to do for cows which have the pink eye.—Subscriber, Calexico.

If the animals have fever, allow each cow two ounces of epsom salt and a half ounce of saltpeter in the drinking water or bran twice daily. Bathe the eyes with warm water and apply to the eyeballs twice daily, with a soft clean feather, a few drops of a solution containing the following ingredients: distilled water two ounces, camphor water two ounces, boric acid a half drachm, and morphine five grains.

Nasal Catarrh or Glanders?

My mare lost her colt in February but recovered completely. Recently a thick, yellow and foul smelling discharge has been running from the left nostril. Now this discharge has changed to a thin somewhat greenish matter with very little odor. Her appetite remained as usual until this morning and there has been no swelling about the head or mouth. Today she is worse, turns her head from side to side as if in pain, eats nothing and drinks but little water. The flanks are drawn in and she grunts when moved. She has been sick ten days, but has had no opportunity to contract distemper or glanders.—Subscriber, Valley Center.

In all probability pneumonia or lung fever has developed from the extension of the catarrhal condition of the head. The course of the disease, a discharge from one nostril only, without loss of appetite, followed in about ten days by general systemic disturbances, justifies the fear of glanders, though other symptoms—farcy buds, swollen limbs, ulcers on the limbs and in the nostrils, etc.—are not mentioned in confirmation of this diagnosis. However, in all similarly suspicious cases it is advisable to exercise precautions to prevent the spread of the disease and, since glanders is transmissible to man, do not forget your own protection. Employ a qualified veterinarian to diagnose this case and treat it if he thinks advisable.—F. G. M.

Cowpox (Variola).

Kindly define and describe cowpox and advise us if sheep dip will cure the disease.—Subscriber, Escondido.

Cowpox is a febrile disease of cattle and horses supposed to correspond to smallpox in man. After a period of incubation of two days' duration a preliminary fever, which may not be noticed, papular eruptions appear over the entire body surface, though often observed most distinctly on the teats, udder and other parts thinly covered by hair. The papules are small red nodules which increase to the size of a dime when the surface presents a depressed center surrounded by a firm elevated margin, bluish red and outside of this a softer pink zone. Later a yellowish lymph exudes and dries, forming crusts which are detached usually about three weeks after the onset of the disease, leaving when they fall off a permanent pit in the skin. There is no cure. The

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Cementing Reservoir.

I have been a pleased reader of your paper for over fourteen years, and now come to you for information regarding cementing of reservoir. It was dug in early winter in heavy sandy loam and is 25x35x5 feet. Would you use cobblestones on bottom or cement on the ground? Will reinforcing with wire prevent cracking? What proportions should be used? How thick should the walls be?—Subscriber, Whittier.

It is possible that if the ground is well settled and the reservoir is intended for temporary purposes cementing on well tamped soil may be all right. We have seen such reservoirs, but they almost invariably cracked. We do not think the coating would be thick enough to allow reinforcing and believe it would be more expensive than the use of concrete of sufficient thickness. If concrete is used so small a reservoir as this should not need reinforcing. The proportions for good, waterproof concrete are 1-2-4, that is, 1 part of first-class Portland cement, two parts sharp sand and four parts coarse gravel or crushed rock; if clean, sharp gravel is used, 1 part of cement to 4 parts of gravel. This presumes more or less sand as a part of the gravel. If the sides of your reservoir are not vertical, but follow the slope of the bank, you can use a medium wet mixture of the concrete of a jelly-like consistency. If sides are vertical, forms are necessary. Mixed to this consistency treading with the feet may be sufficient to do the proper packing, but something to "ram" with is perhaps surer to remove air and bring closer contact. On the bottom where there is no danger of running it may be used wetter. If in a hurry it must be borne in mind that the drier the concrete the quicker it sets. Mortar for the surface may be made in the proportions of one part cement to two parts sand. This will make a good, strong concrete, though it is barely possible that contraction may cause cracking. If walls are vertical they should be one foot or 16 inches thick at bottom and may taper slightly. Would advise strengthening by banking with dirt.

Walnut Root Rot.

The blackened root of a young walnut tree was recently sent for determination of cause of death of the tree to Prof. Ralph E. Smith of the Pathological Laboratory at Whittier, and he writes:

"The young walnut tree of which you send me a portion probably died of root rot, a disease which attacks seedlings occasionally. This is not a very serious matter and need not cause any anxiety."

Egg Sucking Dog.

I have a thoroughbred cocker spaniel who has learned the bad habit of sucking eggs. I have given him egg filled with red pepper, but it has not cured him. Can anyone make a suggestion that will work, as I am desirous of saving the puppy if possible.—W. C. S., Glenn.

On Page 647 of last issue is a remedy, and we will ask dog fanciers for a better one.

Raisin Seed.

Is there any food value in raisin seed?—Rancher, Parlier.

There is value but we have not analysis at hand. We question, however, whether they would be good for feed without grinding, but they are the basis of a certain stock food manufactured in the San Joaquin Valley.

Best Oranges.

What is best variety of oranges for home use to get juicy and very sweet fruit, without so much regard to size or shape? Why is it that russet oranges are not in more general cultivation?—Subscriber, El Cajon.

The Washington Navel is doubtless the finest orange grown. As you say that you wish to grow fruit for home use only, you may wish to extend the fruiting season by planting in addition varieties which will ripen or hold their fruit longer. The Navel will drop much of its fruit before June 1st while the Valencia will hold on all summer and into the fall. The St. Michael is a good little orange coming in between. Another nice orange for home use is the Tangerine, Mandarin or Satsuma; these three are much the same. Russet oranges are not in general cultivation because the russet appearance is caused by an insect which has never yet been introduced into California. It is hoped that it never will be.

Thinning Fruit.

Our pears are setting in clusters of six or more. Should they be thinned? If so how many should be left? These pears are now dark reddish brown all over. What variety might they be?—Newcomer, El Cajon.

We surely should thin the pears, not leaving more than one or two to the cluster. From the description we cannot give the name of the variety.

Alligator Pears.

Is there much demand in the markets for alligator pears, and are they difficult to raise?—Newcomer, El Cajon.

We refer the inquirer to editorial in last number. Alligator pears are not difficult to raise, requiring much the same care as oranges and will not stand any colder temperature. As suggested in the editorial, we would not plant extensively until market conditions have been proven.

Lady Birds.

Kindly inform me if lady birds benefit or harm fruit trees, olive, orange or lemon.—Subscriber, Jamacha.

The lady bird does not injure trees or any vegetable growth. It lives only

on other insects, and is universally considered a blessing to the fruit grower.

Cracking of Bark.

What is the cause and remedy for bark cracking and peeling off of orange trees?—Subscriber, Jamacha.

We imagine this is a case of gum disease and the best answer is to refer our subscriber to the leading article in the issue of the Cultivator of April 13th written by Mr. A. F. Call of Corona and considered the most satisfactory treatment of the subject ever published.

Lizards in Apiary.

How shall I rid my apiary of lizards; they hang around and catch the bees as they come in? My loss is very great.—Subscriber Hemet.

This is a new question in apiculture. We will ask apiarists who have had to do with this pest to give their experience. We fancy a boy with a good swift stick to go after them, would do the work.

Diarrhoea.

I have lost one hen and have another that has been sick for two weeks with diarrhoea. Have looked my copies of the Cultivator over but fail to find any article on that trouble. They begin with a watery discharge and then it becomes yellow with green. They refuse to eat, just stand around, grow weak and poor. The eyes are bright not droopish like cholera. Is there anything that I could do to prevent the others taking it.—L. B. W., Whittier.

The usual causes of diarrhoea here are wrong feeding; too much meat in the food; too little green food, at least one-third of the food should be green food in this climate; overdosing with pepper and condition powders, foul water, want of shade in hot weather, dampness, uncleanliness, crowding and vermin; these may one or all cause diarrhoea.

It is necessary to remove the cause and then nature with but little assistance will do the rest. A little charcoal in the food or granulated charcoal in a box like the grit box kept always before the fowls, will assist. Rice boiled in milk with a tablespoonful of ground cinnamon to each pint of the milk will often effect a cure, but it should be preceded by a small dose of castor oil to clear the bowels, or if there is any feverishness give ten or fifteen grains (a small half teaspoonful) of Epsom salts. Be sure to give plenty of clean water. Most of the diarrhoea near here comes from dirty drinking vessels and bad water, combined with lice.—A. B.

Congestion of the Liver.

Will you please tell me what is the matter with my chickens and what to do for them. They lie with their heads on their backs and die in a few minutes after I find them. They don't seem to be droopy and I cannot see anything wrong after they die, only a great deal of blood in the liver. They gather milo maize and that is all they eat. It seems that they have plenty of grit.—Mrs. W. J. R., El Centro.

Your chickens have evidently congestion of the liver, and I think that is brought on by their eating some putrid animal food, such as dead gophers or rats. It might be from anything mouldy or mildew of any kind, or from maggots off a dead animal or fowl. I used to find my hens like that in Oklahoma and I thought it was from the sting or bite of a poisonous insect. I gave mine one drop of aconite in a teaspoonful of milk and I almost always saved them. Occasionally when the sun is very hot and the chickens have not shade enough they get a sunstroke and I found that a pill of asafoetida followed by a little epsom salts in the water and supplying shade was the best thing. I would advise you to give a chick as soon as you see it ill a small dose of turpentine and castor oil, from 2 to 10 drops of turpentine oil in half or a teaspoonful of castor oil according to the age of the chicken. Then in half an hour give a teaspoonful of the following mixture: take a fresh raw egg, put in a bottle and add as much olive oil as there is egg, shake well and when well mixed give a teaspoonful every three hours. Shut up all the fowls until the dead animal is dried up or eaten up by the maggots or ants, or you have found it and buried it.—A. B.

Tape Worms.

Please answer in your paper what I shall do for my little turkeys. They are two weeks to two months old, look healthy but every day one or two begin to droop wings, look sleepy, do not eat and in 24 to 36 hours die. I lost about a dozen that way and it seems not only to trouble me but every one in here. I opened two of the dead ones. The crop was empty, the liver red, smooth and solid; in the stomach there was only grit; in the bowels I found some objects that were white, about 1 to 1½ inches long, and looked like small band worms composed of links. Do you think that killed the turkeys.—H. H., Brawley.

I think from your description of the little worms in your little dead turkeys that they have tapeworms which killed them. And I would advise you to keep the turkeys up for a day and at the supper time give them stewed garlic, chop the garlic up and stew it in very little water. You might add after you take it off the fire a little bran. Give that to the turkeys for the evening meal and I think that you will find that it will get rid of the tapeworms, but you must be sure to clean up all the droppings as the turkeys will eat the worms and the trouble will begin all over again. Each little joint of the worm lays eggs that are almost invisible. If the garlic does not get rid of them, but I think it will, you must give each turkey a dose of tincture of "Male Fern," from five to ten drops of it according to the size or age of the turkey. It should be given on a small lump of bread; given in the morning on an empty stomach and followed in an hour by a dose of castor oil (from a half teaspoonful to a full teaspoonful). Give plenty of onions chopped fine in the food. The onions keep away worms and are a good tonic to the liver and the kidneys.—A. B.

Care of Young Orange Trees.

What is the proper care to give the trees of a young orange grove the season after planting? (Washington and Thompson Navels). Should they be protected by some sort of wrapper or not during the summer months? Should the young sprouts be allowed to grow on the body below the top or not? If so, to what extent? When is the proper season for pruning if any is needed? How is the best way to straighten or tie up a tree where the body is crooked or is leaning?—Subscriber.

Full answer to this question would require several columns, but we assume the writer does not wish to know as to irrigation and cultivation. Both should be thorough, though the irrigation will depend upon the condition of the soil and subsoil. The wrapping of the trees is advisable, as it saves thumb pruning to keep down sucker growth and prevents sunburn. Old newspapers will answer, but we much prefer the ordinary yucca or other prepared wrap. These are advertised in the Cultivator and may be had so cheaply that it is hardly worth time to worry with newspapers or other makeshifts. If anything is used that requires tying with cord, care must be taken not to make the tie so tight that the bark will grow over it, and it must be watched to prevent cutting in the next season in any case. Some prefer to let the young sprouts grow until a few inches long, then pinch off ends to check growth. The following spring they may be removed smoothly next to the trunk. This growth shades the trunk and makes it stockier and lessens liability of tree bending over. The best season for pruning is early in the spring. If it has not been done on last year's setting, it should be at once, for the pruning of an orange tree is not a serious matter; it usually cares for itself excepting for occasional cross branches or two limbs branching out at the same place which may cause a split later on. On question of pruning the bearing trees would refer our inquirer to articles of Mr. Paine in former issues. The best way to stake young trees is to drive a stake 1¼ or 1½ by 2 some two or three inches from the tree and tie the tree firmly so that it will not sway in the breeze and chafe against the stake. These stakes may be allowed to stand for several years.

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth street, Los Angeles.

VETERINARY.

(Continued from Page 672.)

medicines indicated are epsom salts as a laxative and vaseline or bland oils applied to the teats.—F. G. M.

Inflamed Hock.

One month ago my horse was hurt in the left hock joint. He is very lame now, barely touching the toe to the ground when walking. The animal is becoming thinner every day and injured limb is perishing above the hock.—Subscriber, Moody.

An injury causing lameness so severe and persisting one month, will probably result in a permanently stiff joint. Blister the part with an ointment composed of cerate of cantharides two ounces, red mercuric iodide two drachms, and mixed thoroughly and softened by the addition of a little turpentine. Clip the hair from the hock; apply the ointment and rub briskly. Tie the horse so he cannot reach the blister with his mouth and remove with warm water and soap after 24 hours. Repeat after three weeks if necessary.—F. G. M.

Lymphangitis.

My mare is still very lame. I cannot find anything wrong with the foot but the inside of the ankle joint and the hock is very painful. The swelling is reducing and there seems to be some improvement in the lameness. —Subscriber, Kerman.

A reliable liniment may be made by mixing turpentine one part, ammonia one part, and sweet oil two parts. Shake and apply twice daily to the swollen limb and rub briskly.—F. G. M.

Breast Injured.

A saddle horse seven years old had a swelling appear on the breast in February. This opened just above the breast bone and has discharged blood and matter ever since. The horse is in fair condition. Is this lung fever?—Subscriber, Holtville.

No symptom mentioned indicates lung fever which is another name for pneumonia. Introduce a probe into the opening and ascertain the depth of the tract and also search for any foreign body, sliver of wood, thorn, etc., which may have lodged in the flesh. Mix zinc chloride 2 drachms and flour 3 drachms and add water to make a paste. Smear the paste on both sides of a strip or string of cloth and pack the tract with this strip, being careful to force part of it to the bottom of the cavity. Within a week the diseased flesh will separate and may be lifted out with tweezers. Then treat the larger opening with injections of hydrogen peroxide.—F. G. M.

Cough in Pigs.

Two pigs about ten weeks old have had a dry cough about four weeks. They seem healthy otherwise.—Subscriber, Napa.

Provide comfortable sleeping quarters free from dust or draft. Allow each pig two teaspoonfuls of oil of turpentine in molasses or honey, mixed with the feed, once daily, three days in succession. Cough in pigs may originate from various causes. The treatment advised is most suitable when worms are the causative agent.—F. G. M.

Bunch on the Leg.

A bunch the size of a table spoon remains on the leg of my horse following an injury from a kick. Can the bunch be removed?—Subscriber, Puente.

Rub briskly twice daily with a liniment composed of tincture of iodine half ounce, chloroform half ounce and spirits camphor three ounces.—F. G. M.

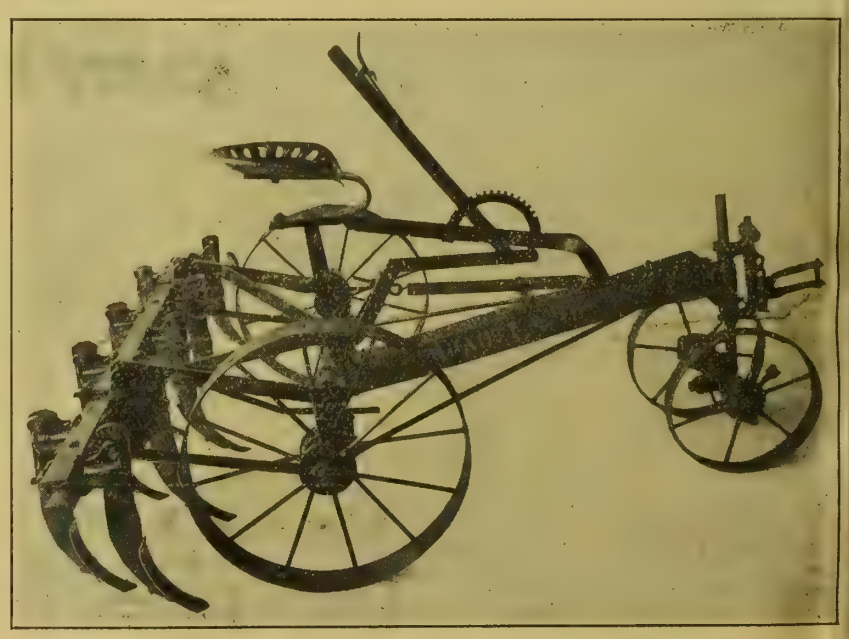
DAIRYING THE NEW WAY.

(Continued from Page 665.)

cuss matters pertaining to their business.

As the boys get a better insight into the business, it opens up a way for them, and they become more and more interested in learning it. They can see that profits are measured largely by their degree of capability in management. Their minds are awakened to greater effort as they see the advantages arising from using good blood. They can see the difference in good care and poor care and the results arising from the same.

Then to the dairyman's boys there will occur the necessity and possibility of improving the producing capabilities of the farm, making it possible to keep more cows; improving the equipment in the way of buildings which will enable them to give the cows better care. With the better equipment and more cows the business will be more interesting because it is more profitable.—The Gleaner.



The Arnott Improved Orchard Cultivator

WE are pleased to be able to announce that prompt shipments can now be made of the **New Arnott Cultivator** as shown above. This has been for years the most popular cultivator in the Southwest and with the **New Fore Truck** it is way in advance of any other orchard tool

Orland Hatchery—White Leghorn chix, $8.50 per 100. $80.00 per 1,000. Brown Leghorn chix, $8.50 per 100. P. L. Simpson, Orland, Cal.

POULTRY

1889-1911—Barred Plymouth Rocks, Ocean Blue Strain. Birds of our breeding made a phenomenal record in the hands of our customers this season. Won first place at five of the largest Coast shows, besides many shape and color specials. Fourteen silver loving cups were won by this strain. We won in every class at the big Los Angeles Show—something no other exhibitor of Barred Plymouth Rocks can claim. Every female in pullet pen for this season is a winner either in pens or singles. Every male heading cockerel mated pens this season is a winner either singly or in pens. We are ready now for your egg orders. Same old price—$3 and $5. Mr. and Mrs. D. T. Wieland, Moneta, Cal. Take Redondo car via Moneta avenue. Get off at Illinois street, right on ranch.

All We Know is Rhode Island Red Chickens. But we know them so well that our baby chix, $15 a 100, are the best on earth. There! Pure blood, good strains, well mated by expert breeders. I. X. L. Poultry Yards, 587 Mission St., Santa Cruz, Cal.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

The Goodacre Strains—Just the time to get our Quality Reds, our special offer on eggs from choice matings of $3.00 per 15 or $5 00 per 30 is hard to equal; our commercial day-old chicks we now offer in 100 lots at $12.00; our Reds have been constant winners the past three years in our Coast shows. We can sell you choice eggs, Buff Orpingtons, Anconas and White Runner Ducks. Write us today. Goodacre Bros., Compton, Cal.

Hayes, R. B., Poultry Fancier and Rhode Island Red Specialist—30 breeding pens of Reds, 20 pens miscellaneous varieties. See our birds, they tell their own story, or write for circular. Eggs for sale only. Yards in Arroyo, opposite Ostrich Farm. Box 35, Garvanza Sta., Los Angeles, Cal. Phone East 1631.

Eggs $1.00, 15; $5.00 per 100. Chicks $15.00 per 100, $12.50 for incubator lots. R. I. Reds, Barred Plymouth Rocks and B. Orpingtons. A few B. Orpington pullets for sale. Cash with order or stamped envelope for reply. L. W. Neilsen, R. R. 2, Box 1 A, Petaluma, Cal.

Baby Chicks from my pure-bred stock S. C. White Leghorns, carefully selected for laying and standard qualities. $9.00 per 100, $85.00 per 1000. Eggs for hatching $5.00 per 100. Correspondence solicited. J. R. Heinrich Poultry Yards, Arroyo Grande, Cal.

BONNELL'S S. C. BLACK MINORCAS
WIN EVERY TIME
At Los Angeles Show, 1911, every first premium and three silver cups; 2 specials for best male and female. Eggs at $5 and $3 per setting. C. C. Bonnell, 2919 Brighton Ave., Los Angeles.

Barred Plymouth Rocks—The kind that "Win and Lay." Eggs and stock for sale. C. H. Vodden, Los Gatos, Cal.

Mammoth White Holland Turkey eggs $3.50 per 13 eggs, after May 26th. A. H. Blakely, Ontario, Cal.

For Sale—150 Purebred Barred Plymouth Rock hens, 15 months old, and 15 roosters. S. Malnick, Gossage Ave., Petaluma, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately Allaway & Layton Co., 607 E. 3d St., Los Angeles, Cal.

Settings from splendid strains White and Buff Wyandottes. Prices reduced for months of May and June W. C. Parker, 113 Pacific Ave., Santa Cruz, Cal.

MISCELLANEOUS

It requires but 2 to 4 cents worth of the darkest and cheapest honey to make a gallon of the richest and most delicious beverage drink. It is a perfect substitute for fruit where fruit is scarce, and a perfect substitute for water where water is poor. A tablespoonful of evaporated milk in a glassful makes buttermilk that is worth twice as much as the natural kind. Process and right to use it two years 25 cents. C. W. Dayton, Chatsworth, Cal.

Ranchers—If you grow anything that can be canned we will supply everything but the labor and product and will pay you the highest market price for it. Write or call Growers Home Canning Co., 222 Exchange Bldg., Los Angeles.

H. Eckart, General Contractor, Bridges and Buildings, Reinforced Concrete Water and Oil Reservoirs, 256 Wilcox Bldg., Los Angeles. Phones A2443 or Alhambra 25812.

Imported Carneaux—The great squab pigeon. A limited number of mated pairs at $3.00 per pair. Chas. N. Taylor, Artesia, Cal.

MACHINERY

For Sale—Second-hand windmills, gasoline and steam engines, pumping outfits. Wagons, buggies, 20 sets harness taken in trade by us and must be sold. These are snaps. WICK'S FOWL WHITE FARM, Moorpark, Cal

REDUCING LIVING EXPENSES.

The McStay Supply Co. of Los Angeles is sending out catalogues and put up the claim that they will enable readers of The Cultivator who will send for them to eat more, wear more, and use more, and all for less money than they are now paying. It surely sounds good, and those who know say the McStay Co. will make good. A look over the prices which this firm offers in last week's Cultivator gives a slight inkling of the good things in store for low prices. There is no reason why the farmer should not take advantage of the lowest prices he can secure. He usually takes a low enough price for his own product and when a concern like the McStay Co. makes such a proposition as is now appearing in The Cultivator it should at least call for a post card request for a catalogue.

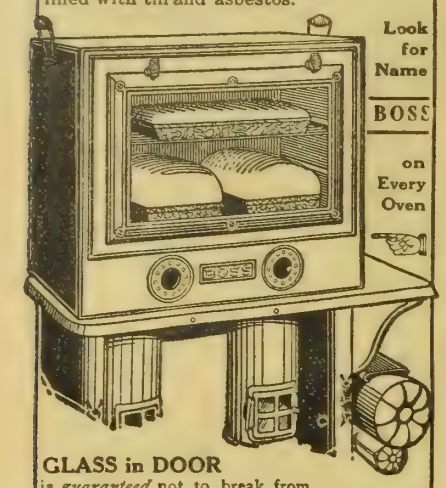
ENSILAGE CUTTERS.

The use of ensilage in dairies was slower of introduction in California than in the East. At one time it was claimed that with our perpetual summer the possibilities of green feed were with us the year around, but the advantages of ensilage, especially during the later summer, have forced themselves upon dairymen until nearly every dairy section uses one or more of the towering silos. The time will soon be here for filling these and the new ones which are being constructed. A great convenience in this work is a thoroughly reliable ensilage cutter. The O. J. Weber Co. of Los Angeles is handling one of the very best of these machines; it is called the Climax Ensilage Cutter, and while it is said that perfection is not attained on this earth, these machines are near enough to it for all practical purposes. Mr. Weber says "They are unequaled in simplicity, strength, durability, safety in operation, and the excellent quality and uniformity of silage produced." Write Weber; he will tell you all about it.

USE A PORTABLE
BOSS OVEN
With Patented **GLASS DOOR**

on *your* stove or range, either oil, gasoline, acetylene, alcohol or gas.

No more spoiled bakings or worry—No more wasted heat—No more jarring or chilling of oven. Housewives can see their baking without opening door. Economy and convenience both guaranteed in the BOSS—a polished blued steel oven lined with tin and asbestos.



GLASS in DOOR
is *guaranteed* not to break from heat because it is secured by our patented *yielding pressure* retaining strips, which permit expansion and contraction. Glass door fits snugly in one-piece beaded front, and is held tightly in place with two turnbuckles, preventing escape of heat.

Baking qualities and ventilation superior to any other oven or range. All heat goes right into the open bottom, and is perfectly distributed to all parts of the oven by means of our patented Heat Deflector. Flame always visible through small mica windows. With the BOSS a baking costs *less than a cent*. It will many times over *pay for itself* in saved bakings to say nothing of saved fuel.

Ask YOUR Dealer to show you the BOSS Glass Door Oven. INSIST upon seeing the name "BOSS" stamped in the front of Oven. Then you know that it is genuine and *guaranteed*.

FREE: Our valuable Recipe Book, containing many cookery helps and full description of BOSS Ovens sent FREE on receipt of postal, plainly written, giving your own and your dealer's names and addresses.

Household Department

THE SONG OF THE HUMBLE BEE.

It was only a little, humble bee,
But the way it worked was a sight to see,
As it gaily flew from flower to flower,
With its mind intent to improve each hour;
And it hummed a song that was good to hear,
With its lesson of hope and gladsome cheer,
And this is the song of the humble bee,
The song it is singing to you and me:
"Come, be jolly,
Melancholy
Is the sheerest kind of folly!
Don't be shirking,
Just keep working,
Somewhere joy for you is lurking!
Though the world seem full of care,
Clear your mind,
Search, you'll find
Honey's in it everywhere!"
Now do you not think that the bee sings true,
And to search for honey's the thing to do,
And it's better to work and to smile and hope
Than to sigh and cry and to whine and mope?
Be up and doing and cheery and bright,
Look not at the darkness, but for the light;
It is there just ahead, though you may not see,
But you will if you'll sing with the humble bee:
"Come, be jolly,
Melancholy
Is the sheerest kind of folly!
Don't be shirking,
Just keep working,
Though the world seem full of care,
Somewhere joy for you is lurking!
Clear your mind,
Search, you'll find
Honey's in it everywhere!"
—Woman's Home Companion.

"THIRTY PIECES OF SILVER."

The old man dashed his hand across his eyes as he turned from the gate and walked slowly toward the house. At the door he hesitated, took a step inside, then, catching sight of "Mother" sitting in the next room, her apron thrown over her face as if to shut out some dread sight, he moved slowly toward the barn; half way there, he drew himself up, slowly muttering: "Seems to me I can't go nowhere; Mother's in the house, and Pigeon ain't in the barn. Oh! I almost wish I hadn't done it, but seems like I had to; I reckon I better chop an armful of wood."

Mother, inside wiping her eyes, was not deceived by the unusually strong, rapid strokes of the ax. "Poor Pap! I reckon he thought it was the best thing to do—but dear old Pigeon! Oh, I can't bear it!"

The evening meal was a silent one save for a few desultory remarks about the milking; there was not much else to talk about now but Brindle. After the chores were done they sat down, but not together tonight; Father preferred the back step, Mother a chair by the front door; but memory was carrying both back over the same road. Both saw a comfortable eastern home, themselves full of life and ambition, elastic of step, dark of tress, bright of eye. They saw many other things, but just tonight the central figure was a handsome young horse, whose sleek gray coat felt like velvet; whose neck arched coquettishly; whose liquid eyes alternately flashed fire or melted in tenderness more than human. The old man straightened as he seemed once more to be astride her and felt the exhilaration of flying along the scented highway. There was no steed in all that country that could compare with Pigeon. Mettlesome, but true as steel, she endeared herself to every member of the family; was, in fact, one of the family.

Then the western fever struck her owner; he would get away from the small, worn-out farm; he would go west, where he could have all the land he wanted. Hundreds of miles Pigeon and her mate drew the heavy prairie schooner—how wearisome and footsore even her owner could not know. Timber crazy, he elected to carve his home out of the heart of the forest, a hard life for man and beast. Other horses might come and go, but Pigeon was ever faithful. Her intelligence was something remarkable, and the fact that she could not be lost in that trackless wilderness gave her a local reputation. Any trail or cow path she would follow unerringly.

Barns, commonly known as stables in those days, were mostly built of unhewn logs, with low doors and rafters. Pigeon held her head high, and, it was supposed from continual bumping, the disease termed poll evil set in. With drawn face the old man recalled the years of suffering, coupled with faithful service, that followed. Veterinary science was in its infancy, but everyone who came along had a remedy, and each tried without regard to the suffering it caused.

But—and the old man tried to resume the train of reasoning which had made the day's deed possible—he himself was broken in health, the children gone, he and Mother were poor, the farm was let on shares, and his share was so small, and Pigeon—well, her head was so bad, and she was so old and crippled, she really could not do the work and travel he had to do, so—God forgive him!—he had sold her—torn her from the farm which she had so largely helped to make, from the associations of almost a quarter of a century, from the dear, familiar voice of master and mistress, from the tender greetings of the children when they came home, from everything that her true heart held dear—sold her to a stranger for thirty dollars, with which he purposed to buy another, old it would need be, but without that terrible poll evil. But now that it was done, and the evening shadows drew around, it seemed shockingly lonesome without Pigeon—and where was she? Had she realized her fate, or why had she, for the first time in her life, shown fear of a stranger? Why had she neighed as long as her voice could be heard? Something hot splashed on Father's hand; that was the first he knew he was crying. Again he tried to brace up. "Everybody has to do the best he can for himself. Everybody sells old horses, and—." But still the look in Pigeon's eyes as she turned them on him at the last haunted him, and something about that thirty dollars reminded him of the "thirty pieces of silver." Only another of the sad tragedies that come as a reward at the end of countless faithful horses' lives had happened.

* * * * * *

It was the tenth sleepless night that Father, about midnight, started up suddenly, exclaiming: "Mother, d'ye hear anything? Mother!"

"Seemed like I dreamed I heard Pigeon neigh. Hark!"

There it was again, a distant but insistent call. Trembling with excitement, the old man hurried out into the moonlit night just as the gaunt form of a gray mare emerged from the shadowy wood. Mother, trailing barefoot through the dewy grass, heard a glad neigh from the one and an exclamation of pleasure from the other, and a moment later man and beast were, so to speak, locked in a fond embrace.

The next day her new owner, on the trail of the fugitive, was satisfied by the return of his "thirty pieces of silver," plus five more, but Father ate, slept, smiled and was happy, and Pigeon—well, she was happy, too.—Practical Farmer.

RESTORING STRAW MATTING.

Matting that begins to show wear so that little ends stick up may be rendered quite as good as new by a coat of thin white shellac. After taking up the matting and cleansing it as usual relay it on the same side and then go over it with the shellac, using about two quarts to a room of the ordinary size.

Coulson's
MADE IN PETALUMA

Special chick food

If nature hatches the egg, you should save the chick. And you can do it with Coulson's Special Chick Food—the greatest life-saver known in the chicken industry.

This food is the result of years of study to get just the right ingredients in a proper mixture to save the largest possible number out of every 100 chicks.

Coulson's Special Chick Food is an investment, not an expense. It pays big dividends by starting chicks on the road to profit for you. Costs about one cent a chick for four weeks' feeding.

Coulson's Growing Chick Food must be used after the first six weeks, to keep up the steady growth of the chicks up to three months, at which time they are old enough to use Coulson's Egg Food—the standard feed for laying hens.

At your dealer's or from us. Write for the interesting book, "Poultry Feeding for Profit." It's free.

A BOX OF CANDY.

Coffee Caramels.

Two cups of granulated sugar, half a cup of very strong coffee, one cup of cream. After the sugar and coffee have boiled five minutes add the cream and continue boiling until the candy strings when dropped from the spoon. Pour into a buttered pan and when cool cut into squares. This candy should boil over a moderate fire, or it will burn. To make the coffee, put two tablespoons of powdered coffee into the bag of a French coffee pot and pour through it one cup of boiling water. When the water has dripped through pour it back over the coffee. Repeat this process twice and the result will be strong enough to give the candy the true coffee flavor. Keep the coffee pot hot while coffee is being made.

Plain Vanilla Candy.

Six pounds of best white sugar, three teaspoons of vanilla extract, one teaspoon of soda, three cups of clear water. Pour the water over the sugar, and, when nearly dissolved, set it over the fire and bring to a boil. Stew steadily until it hardens in cold water, stir in the vanilla, boil one minute, add the dry soda, stirring in well, and instantly turn out upon broad, shallow dishes. Pull as soon as you can handle it, into long white ropes, and cut into lengths when brittle.

Cream Peppermints.

Put a pound of white sugar and one and one-half teaspoons of cream of tartar in a teacup of cold water. Stir until dissolved, then boil until a little of it, cooled in water, can be rolled into a ball with the fingers. Remove from the fire, allow it to cool a little and heat with a spoon until it turns white. Add three drops of oil of peppermint and mix well. If it hardens too quickly while beaten set the bowl in a tin of boiling water. Make it into balls with the hands.

Turkish Delight.

Break an ounce of sheet gelatine into pieces and soak it for two hours in a half cup of cold water. Dissolve two cups of granulated sugar in a half cup of cold water. As soon as it boils, add the gelatine and cook steadily for 20 minutes. Flavor with the rind and juice of an orange, with orange flower water or rose water. Turn into tins wet with cold water, and when it is set cut it into squares. Roll in a mixture of confectioner's sugar and cornstarch. A few chopped nuts may be added to the syrup when it is taken from the fire.

Glaces.

To "glace" nuts and certain kinds of fruit, nothing is needed but sugar and water and a little patience. Boil a pound of sugar with a gill of water until it threads. Drop nuts, figs or grapes into the syrup, one at a time, dipping them out with a buttered fork and dropping them on a buttered tin to dry. Care must be taken not to shake the syrup more than necessary, and it is necessary to work rapidly, as the syrup should be removed from the fire before the nuts or fruits are dipped, and it soon hardens. A teaspoon of vinegar added to it makes a crisper glaze. A second dipping after the first coat hardens greatly improves the appearance of the candy. It should be eaten fresh, as it soon becomes sticky with changes in the atmosphere.

Peanut Brittle.

One pound of granulated sugar, melted in a skillet but not scorched. When melted add a lump of butter size of a walnut and one quart of finely chopped peanuts. Stir well and pour a little on a buttered board; roll thin with a buttered rolling pin as it hardens quickly; continue until all is formed into sheets.

Peanut Creams.

Break into a bowl the white of one egg, add one tablespoon of orange juice and into this gradually stir sufficient sugar to make a thick paste. Mix with it one teacup of finely chopped peanuts. Form into balls, roll in pulverized sugar and lay on buttered dishes to dry. When dry each can be dipped into melted chocolate if preferred.

Maple Caramels.

Two cups of brown sugar, one and one-half cups of maple syrup, one-half cup of cream and one tablespoon of butter. Test the cooking as for chocolate caramels. Pour on buttered shallow pans. Cut in squares when cool. Nuts can be sprinkled on the greased pan before pouring, or stirred into the caramel just before moving from the fire.

Chocolate Fudge.

One-pound cake of chocolate, two pounds of granulated sugar, one cup of cream or rich milk, one teaspoon of vanilla, a large-sized piece of butter, about an eighth of a pound, a good-sized pinch of salt. Dissolve the chocolate over the tea kettle, then mix with it the sugar and cream and return to the stove. After it comes to a boil, stir in the butter and salt. Boil until the mixture forms a very soft ball when dropped in ice water. It should have just consistency enough not to go to pieces when picked up. Beat vigorously, stirring in the vanilla when the candy has cooled slightly. Pour into buttered pans, and when almost set mark in squares with a knife. This is also an excellent icing for chocolate cake.—Rural New Yorker.

A HOUSEWORK APRON.

An apron invaluable to the woman who does her own work is the housework apron made of white rubber sheeting and bound with wash-ribbon. This apron is just the thing to slip over one's dress when cooking or when washing dishes. It is cut circular, and made slightly full at the waist. Then there is a plain bib with straps, which fasten to the narrow belt at the back.—Woman's Home Companion.

IN FOR IT!

"Beats 'Em All for Making Money"

"I have run..... and many other machines, but the Wolverine beats them all for making money. I have put 216 pounds of dry straw in a bale and 175 pounds of hay." (Abstract from letter received. Name and address of party furnished on request.)

From "stem to stern" the Wolverine Hay Press is RIGHT. There isn't a dishonest or careless spot in its whole make-up. We have the biggest plant in the country devoted exclusively to making Hay Presses. The Wolverine has made an enviable reputation—and it is maintaining that reputation and increasing its facilities every year to take care of the growing demand.

A smooth, even, heavy bale comes from the Wolverine Hay Press. It is a fact that dealers will often pay more for hay put up in nice bales. It eats hay as fast as it can be handled by four men in a mow. It can be depended upon to work every hour in the day without a repair man constantly "tinkering" around. It is built for hard, long service.

Wolverine Hay Press

WOLVERINE CONSTRUCTION DEFIES DESTRUCTION

The Wolverine is built both with steel and wood frames, four different sizes, all with double gears, with various equipments to suit the requirements of purchasers. It isn't the cheapest Hay Press made, if first cost is considered, but it is the cheapest baler in the long run because there is an absence of repair bills.

Write FOR THE "Wolverine Book"

Every farmer will find many interesting and instructive things in the "Wolverine Book." A postal will bring this book to you. It's worth asking for.

Dark comb	.12½
Extracted white	.8
Extracted dark	.6½
Beeswax, lb	.24@30

Hay.

Receipts of hay on this market for the past week were 2600 tons, as against 2938 tons the preceding week. With the exception of fancy grades of wheat, wheat and oat, and red oat hay, these receipts move off slowly, and we note some dealers making concessions in prices, in the past week, to effect sales.

Fancy grades of hay are very scarce, and an occasional car of same will bring at times as much as $1.00 per ton in excess of our quotations. Hay cutting is in full blast in a great many sections, and reports as to yield are improving daily.

Export trade has shown somewhat of improvement during the past week, and considerable hay has moved in this direction. This has helped to work off the surplus of the market; otherwise we believe it would have shown still greater weakness.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	.13.50@14.50
No. 1 wheat or wheat & oat	.11.00@12.00
No. 2 wheat or wheat & oat	.10.00@11.00
Choice tame oat	.10.00@12.50
Other tame oat	.8.50@10.50
Wild oat	.9.00@10.00
Stock hay	.6.00@8.00
Alfalfa	.9.00@10.50
Straw, bale	.40@50

Grain.

Barley, fancy	.1.40@1.41¼
Barley, good to choice	.1.35@1.37½
Barley, poor to fair	.1.30@1.32
Oats, white	.1.50@1.60
Rye, new crop	.1.40@1.50
Mustard, brown	.5½
Alfalfa seed	.5½
Millet	.2¾@3¼
Flaxseed	.5@5½
Broom corn seed, ton	.23.50

Feed Stuff.

Alfalfa meal	.17.00
Bran, ton	.28.00@29.00
Feed cornmeal, ton	.33.00@34.00
Cracked corn	.33.00@34.00
Rolled barley, ton	.30.00@31.50
Rolled oats, ton	.29.00@30.00
Middlings	.32.00@34.00
Oil cake, ton	.40.00@41.50
Cocoanut cake, ton	.25.50@26.50
Mixed feed, ton	.25.00@27.00
Shorts	.29.50@30.00

A test of Nitrate of Soda on celery resulted as follows: Crop receiving 675 pounds per acre was ready for market five days earlier than that receiving 475 pounds, and the heavier fertilized tract gave a net profit of $939.13 per acre; while, owing to a most severe drought during the test, the crop that received no nitrate was a practical failure and not worth harvesting. Eighteen dollars and sixty-seven cents in nitrate of soda saved the crop. All the land received 30 bushels slaked lime and 20 tons stable manure per acre, worked into the soil before planting. It is very necessary that celery should have plenty of lime in the form of carbonate,

Deciduous Fruit Market

Sacramento, May 27, 1911.

The following gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, May 26, 1911:

Cherries: Nine cars. The pleasant weather reported in our last letter of the 20th did not last very long, soon changing to very cool weather, which still continues. As a consequence, cherries have not ripened as fast as expected, but nevertheless are being shipped daily from Vacavilla and Suisun, with the promise of carlot shipments from the Santa Clara Valley next week. So far we have had four carloads sold and the fruit has gone at very satisfactory prices. Our first car in Chicago grossed $5554.00. The first in New York, containing 1166 boxes, sold for over $3600.00, an average of $3.10 per box. Our second car in Chicago sold yesterday for $5352.00, while our second car in New York sold at the same time for $6234.00, this being the banner sale for a carload of deciduous fruit.

The later varieties of cherries, such as Tartarian, are now going forward from the early sections in fairly liberal quantities. The first few scattering boxes of Royal Ann and Bing have made their appearance.

Apricots: The first few crates of apricots are now going forward, but there will be no considerable quantity of them for about one week.

There is no change in the situation of plums, peaches, Bartlett pears and grapes. All these varieties are growing nicely and promise well.

Citrus Fruit Market

LOS ANGELES, May 31, 1911.

Navels are not exactly going begging, but the market is looking with disfavor on them. Between off sizes and overripeness and the more satisfactory Valencias only a small portion of the extra fancy fruit is commanding good prices. Shipments are practically ended; a few Seedlings and Mikes will yet go, though Saturday of this week should see the last of those. Valencias are being well received, though some small offs are not commanding the best of prices. Unlike Navels, the Valencias are running to small sizes, but the quality of the fruit is of the very best.

Foreigns are coming in greater quantity, high prices offering special inducements for them, but even with this California lemons are still commanding the top of the market and prices are most satisfactory. It is not thought that the Mediterranean country can supply enough to materially affect the market, and certainly not so long as weather conditions remain as they are.

Shipments.

Shipments of oranges to date since November 1st, 1910: 28,884 cars, lemons 3,812, total 32,696. To same date last year: Oranges 19,044, lemons 2,541, total 21,585.

REASONS FOR SAVING.

California is advancing as no other section of the world, and the opportunities are here for all to advance in proportion to their means. The trouble is with many of us we haven't been saving enough to have the little nest egg to secure the start. The most humble of us may, however, get this start if we will. The best way to do this is, whenever possible, to set aside out of one's earnings each week or each month, a certain sum, placing it in a savings account and by continual deposits and the interest which they earn, from time to time, the depositor is often surprised to find how rapidly the money accumulates and is sometimes surprised to learn how many opportunities for making money in a legitimate, conservative way are offered to those who have money to invest.

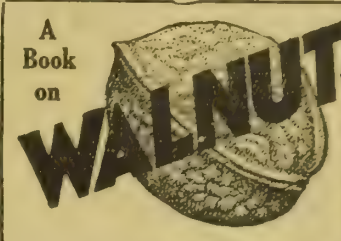
One of the national banks of California has made a specialty of affording the people opportunities for saving their money at interest in a national bank. The reference is made to the Fort Sutter National Bank, of Sacramento, which offers the public certificates of deposit drawing interest at the rate of 2 per cent per annum, when running three months; certificates of deposit running six months draw interest at the rate of 3 per cent per annum, and when running twelve months, draw interest at the rate of 4 per cent per annum. In addition to these certificates, the same bank has its Interest Bearing Department, which issues pass books to the depositors, paying 3½ per cent per annum interest on deposits made from time to time.

The Byron Jackson Iron Works, 357-361 Market St., San Francisco, with works at Carlton Station, manufacturers of pumping machinery, have recently perfected a new and improved pumping system for irrigating farm lands, which possesses unusual merit.

Their patented Automatic Water Balanced Irrigation Pump, direct connected to electric motor, is self-operating and makes an ideal pumping plant, superior to gasoline enginer power in every way. The electric driven direct connected pumping plant allows of irrigation during the night. This means a big gain to growing plant life.

The attention required with gasoline engine power absolutely prohibits all night irrigation, unless extra help is provided. The electric driven direct connected pumping plant is self-operating and requires no attention. The valuable time saved means much: simply turn on the switch to start the plant or close the switch to stop operations. If desired, the switch can be placed in the home, any member of the family can operate the plant from the house, start or stop the plant in one second of time.

A Book on WALNUTS And How to Grow Them



The only book ever written devoted exclusively to the walnut. Gives instructions for planting and propagating compiled from results of twenty years experience in walnut growing. The grafting process as depicted with photographs is applicable to all trees. Prepaid, $1.00.

JOS. M. ANDERSON, 416 J Street
Sacramento, California

350 CANDLE POWER "ELECTRA" KEROSENE (COAL OIL)

Burns common coal oil. Generates gas. Gives 350 candle power light, 20 times more brilliant than common oil lamp, gas or electricity; Burns 5 hours for 1 cent. White, steady light, fine for reading and sewing. No noise or explosions, no smoke or odor. Last longest. Burner fits other lamps.

Fairbanks-Morse
12-25 H. P. Oil Traction Engine

This Tractor

Does All We Claim For It

Read This Letter from a Satisfied Customer in Ventura County:

Fairbanks, Morse & Co.,

Gentlemen:—When the engine was unloaded from the car at Naples, instructions which were furnished were followed and the first stroke of the detonator started the engine. Only a few yards were covered before we stopped in order to get a supply of water and distillate. Again a start was made, and from the depot, at Naples, we proceeded to my property, a distance of 2½ miles, which was covered in one hour. The road being hilly, some grades being 17% to 18%, shows a good performance.

On account of the rolling condition of my land, I had serious doubts of your traction engine fulfilling your guarantee and my anxiety prompted me to make an immediate test. It was my intention to first try it upon pulling a hay baler, which weighs approximately four tons, and the engine was attached to this. With no difficulty the engine pulled the load, without loss of speed, up grades of at least 10%.

The next trial of importance was to get the tractor up a hill where grades of 25% to 27% were encountered. It was here that I received my greatest surprise. You know I had a 20 H.P. Fairbanks-Morse Portable Engine, and this required twelve horses to pull it up these same grades. Your Traction Engine went up without any difficulty, which was more than sufficient to satisfy me that your guarantee had been fulfilled. The trial lasted six hours; up hill, down hill, over rocks and boulders—just about as rough a country as could be imagined—it went without trouble or worry.

Very respectfully,
J. E. DOTY, Naples, Cal.

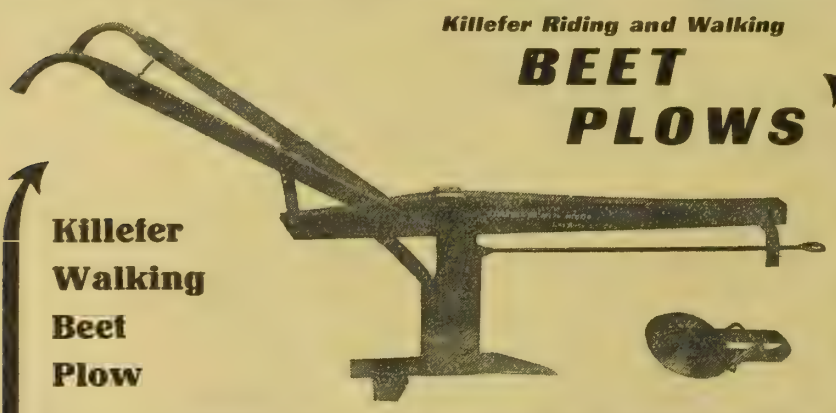
Killefer Riding and Walking

BEET PLOWS



Killefer Walking Beet Plow

This is the strongest plow on the market. Can be had with straight or offset standard, and has one piece land side. Nothing but hard plow steel is used in the Standard Shin Landside and point. Point and Shin are reversible. We guarantee this plow to do satisfactory work in any beet section.

Two Row Riding Beet Plow

It is especially adapted to large acreage, as it does double the work of single plows with but little more draft, and leaves the ground in fine condition for hauling off beets, as it does not throw up large clods.

The Standard Shin Landside Point and wings are made of very hard steel, which we have rolled for this work, and extras are always on hand for immediate shipment.

Both plows can be had with or without steering device. Write or call on us direct if your dealer does not have these tools.

Lemon Blossoms and Why They Fall Off

By Dr. J. Eliot Coit, Southern California Pathological Laboratory.
See Engraving on Cover Page from Photos Taken by Dr. Coit.

Every year during the month of May it is a common thing for the Experiment Station to receive letters from a number of lemon growers expressing a feeling of alarm over what they consider an abnormal and damaging crop of the blossoms. Such persons often take the position that shedding of the bloom is an indication that some element of plant food is lacking in the soil and suggest soil analysis as the logical method by which the trouble may be overcome.

In order to demonstrate the fallacy of such reasoning and at the same time gain more definite knowledge of the subject, the writer has undertaken a series of experiments which are calculated to throw more light on many factors influencing the setting of lemons. While the complete results will not be ready for publication within a year, certain of the preliminary observations are of sufficient general interest to warrant publication at the present time.

Three Kinds of Lemon Blossoms.

Some blossoms may be found on lemon trees at almost any time of the year. There are several periods each year, however, when the bloom is heavier than at other times and these coincide more or less with the different periods of growth. As the vegetative activity of the tree is greatest in the spring, so is the blooming season of April and May the heaviest of the year.

The spring bloom is made up of three kinds of buds, viz.: split buds, abortive buds, and normal buds. A considerable proportion of the spring buds are what I will call, for lack of a better name, "split buds." They are peculiar in that they do not develop properly, are full width but very short and stubby. They usually split open and expose the pistil which shows a dark spot on the stigma. The petals are not developed. All of this type of buds fall off either just before or just after splitting. I have never known one to set fruit. Their nature is not well understood nor is their function known.

Abortive buds have the petals and stamens fully developed but the pistil is represented by a mere rudiment. Such buds open wide and are very showy, but of course never set lemons, as they lack the female parts. The normal buds are long and cylindrical before opening and when open present a perfect development of petals, stamens, and a large, plump and conspicuous pistil. It is from this type of bud only that lemons are produced. Usually a great many more normal blossoms are borne than the tree could possibly mature lemons, and as a consequence there is a struggle for life between them, the smaller and weaker ones being shed off and the stronger remaining to maturity.

It is therefore perhaps safe to say in regard to the spring bloom that if 10 per cent. of the total buds that form, or 20 per cent. of the total blossoms that open, or 40 per cent. of the normal blossoms that open set and mature fruit, a very satisfactory crop will result. Many lemon growers are prone to become alarmed at the large number of blossoms and small lemons seen on the ground during May. It is suggested that if they focus their attention on the young and inconspicuous fruit still on the tree, prospects will be decidedly brighter. There is a limit to the amount of lemons a healthy tree can produce. If the weather is favorable the tree will set many more lemons than it can mature, hence a drop taking place, during the first unfavorable weather, is perfectly natural. Of course there may be in certain special cases an abnormal dropping of the fruit due to certain well understood causes, such as a sudden very hot wind on an orchard already needing water; cutting too many large roots with the subsoil plow in shallow soil; applying improperly mixed sprays; or perhaps an unusually severe attack of red spider or scale. Such cases are easily understood and require no further discussion.

It has been claimed in certain quarters that much of the dropping of lemon and orange flowers is caused by the withertip fungus. The writer does not believe this to be the case. While the withertip fungus is common in all the orchards on trash under the trees and on senile leaves still clinging to the branches, and may even occasionally be found on young fruit predestined to fall from other causes, I have never yet seen a single healthy lemon or orange bud or fruit which was dropped by the withertip fungus. There is a common saprophytic fungus, a species of Cladosporium, which grows on the stigmas and styles of the blossoms after the petals fall. As these styles should fall off any way, the fungus is of no importance and the brown spots on the stigmas caused by it are no cause for alarm. Cladosporium grew abundantly on the stigmas of many of the blossoms under our paper bags with no injurious effect on the lemons whatever. It may be possible for withertip dropping to occur in certain situations along the coast which may be exposed to cold sea winds. Such instances, however, are quite rare and should be easily controlled with Bordeaux mixture. It is idle for lemon growers who are located away from the coast to worry about such an imaginary evil.

As a result of experiments carried out this spring it has been found that pollination of the blossoms of lemons is not necessary for the setting of fruit. In this the lemon differs radically from the deciduous fruits, the proper pollination of which is a very important matter. Lemons will set just as well with no pollen whatever as they will with pollen. Bees are undesirable in lemon orchards because they may cause the lemons to contain more seed by bringing about pollination and fertilization. The Eureka has practically no pollen. In the course of two or three hours search it is possible to find a flower with one or two anthers which may contain a few grains of pollen. For all practical purposes the Eureka lemon is as lacking in pollen as the Washington Navel orange. The Lisbon, on the other hand, bears an abundance of pollen. In this variety about 60 per cent. of the grains of pollen are shrunken and void, while perhaps 40 per cent. are round and plump, some of which will germinate readily under the microscope in a 10 per cent. solution of sugar in water. It is therefore evident that lemon bloom is not shed on account of a lack of pollination, for this is not at all necessary.

I wish to point out an error in another belief commonly held by lemon growers. The statement has been widely accepted that while oranges fruit on new growth of the season like the quince, lemons fruit on old wood like the peach. This is not strictly true for the lemon buds appear on very short but nevertheless new growth each year. If a bud on an old interior limb be carefully examined it will be found that the stem or peduncle is really a shortened branch bearing small foliar bracts which represent abortive leaves.

It is expected that a continuation of these studies will yield additional points of interest, such as the effect of pollen on seed production, and the possibility of producing and advertising a strictly seedless lemon.

The Necessity for City and County Foresters

An Address by J. H. Reed Before the Arboricultural Conference, Los Angeles, May 24-25

In a recent address by Horace McFarland, president of the American Civic Association, before the American Association of Park Superintendents, he quoted the following from former Mayor McClellan's writings:

"In a self governing community, the ultimate object of government is the happiness of the governed. Something more is needed to make the happy city than health and wealth and wisdom. The city healthy, the city wealthy, and the city wise, may excite satisfaction, complaisance and pride, but it is the city beautiful that compels and retains the love of her people."

The sum of human happiness depends in no small degree on our immediate surroundings, on the things most constantly in sight. At least this is true of people of more or less culture, in its broad sense, and to those without this culture from inheritance or training, those who do not seek to surround themselves with pleasing objects, if encouraged by others to do so, these pleasing objects become a means of training and education to better tastes and more enjoyment. Hence we find the tendency to provide our homes with things of good taste and beauty is constantly increasing. Not only our parlors where we occasionally entertain our friends, but our living rooms that are occupied constantly must be pleasingly fitted up with things that add to everyday enjoyment. We are constantly demanding more and more pleasing architecture for our homes, whether they be the mansions of the rich or inexpensive cottages of the laborer. If the yard is embellished by lawn and flowers, the everyday enjoyment of the house is greatly increased.

You get my thought. The sum of the day by day enjoyment of our lives is materially increased, if our immediate surroundings are pleasing. This fact is utilized outside of our residences. The offices of our professional and business men, where they spend their working hours, are tastefully, if not elegantly furnished. The merchant goes to large expense to make his business place attractive, not only to please his customers, but because there is more satisfaction, more enjoyment in doing business with pleasing surroundings. The principle is being recognized by manufacturers who care for the best well being of their operatives. Not only the interior of those working places are often made attractive, but the surroundings of the buildings are beautified.

I was much interested in a letter to his father by one of our Riverside large orange growers, recently written from Hartford, Conn. The family has several extensive packing houses where many men and women work much of the year. He says "I find one thing here which I think we might adopt about our packing houses to advantage. Many of the factories are set in large grounds, which have been beautifully parked and are well cared for." Those of you who are familiar with that beautiful city will recall this feature with pleasure.

Till recently the grounds around our public school buildings, as a rule, were bare and unattractive places. Now they are being beautified, adding immeasurably to the daily enjoyment and culture of millions of children.

On this coast our railroads are accustomed to put a little dab of green and a few date palms near their homely stations. In the East, on many roads, they do better. On some of the important lines the rights of way, for long distance, are being parked, as they are in England, adding immensely to the enjoyment and culture of the thousands of trainmen, as well as to the pleasure of the millions of passengers.

After our homes and places of business, the streets of our home cities are the most immediate, intimate places to make or mar our daily pleasure. It is just beginning to dawn upon us that we have been neglecting a most important means of adding to the everyday enjoyment of the people of our cities.

In the aggregate, an immense amount of time is spent on our streets every day. We must admit that for the most part, they are dull, uninviting, often repulsive lanes, even through important residence sections, often most woefully bare of the artistic feature that has so much to do with our daily happiness.

Why has the beautification of our streets been so long and grievously neglected? It is not entirely from the lack of appreciation of beautified streets. In most of our cities there are streets made attractive by trees and lawns. These are popular places where people go to walk or drive. But they are the exceptions, the majority being merely passage ways for travel and traffic.

There have been various efforts made to induce street tree planting more generally. I remember very well when village improvement societies began to be organized fifty or more years ago, and many a New England town bears distinct results from those efforts to this day. But for the most part, the movement was temporary. It depended on the enthusiasm and organized ability of a few individual leaders. When their day had passed, as a rule there was no one to take the work up and carry it on.

In more recent years, organized efforts of various sorts for street tree planting have been undertaken in many places. A few cities have been permanently benefited, but, because voluntary organized effort is difficult

to keep up in carrying on any kind of public improvement, such efforts are comparatively short lived.

Municipal Control.

The modern plan of municipal control has now come to solve the problem of street beautification. In spite of its having been left for so long to the individual taste and judgment that adjoining property owners have felt that they have a right to control their street frontages, this plan appeals so strongly to the judgment of those most interested in the beautification of our cities that it is being rapidly adopted all over the country. There are more cities now in the little state of New Jersey managing directly and fully their street beautification than there were in the entire country six years ago, and, as the absurdity in theory and inefficiency in practice of the old system is brought to the attention of the people, the more rapidly will the new plan be adopted.

Street tree planting fortunately is becoming popular, at least in speech and print. But most people have really little notion of what the thing means. Many think it means simply putting trees in the ground, while it should mean selecting the right tree for the proper place, planting it properly and then caring for it properly or continually.

Arbor days have been popular in some places. Sometimes whole communities turn out to plant trees on the streets on such occasions, but I have not known this to be tried in any place the second time. During the past winter a large department store in an eastern city made much ado about offering a million catalpa trees to school children to plant on the streets. A splendid advertisement for the store, but for reasons appearing in this discussion later on, a real misfortune to the beautification of the streets of the city. All this sort of generosity in providing trees and voluntary planting reads well in the papers and sounds well in speeches, but does not materialize in satisfactory street trees.

I am reminded of an incident that illustrates this matter of donating trees. When in Washington recently, my attention was called to a conspicuous row of trees near the water border of the Potomac Park that quite disfigured that portion of the beautiful park. It was explained to me that the trees were a personal present from the emperor of China, a very noted tree in that country, but its behavior in the, to it, strange location, was very disappointing, and the order had already been given to have them removed.

After a somewhat comprehensive study of this street tree planting matter for several years, I have come to the conclusion that before any general, permanent, fully satisfactory progress can be made in the street beautification of our cities, it must be taken over by the cities, and managed by them as fully as are now the roadways, the sidewalks, the lighting and other already admitted strictly municipal affairs.

Going in to the reasons for municipal control more definitely, it will be conceded that not one in one hundred of city residents is competent to choose the right tree for a given block or street, considering all the conditions that have to do with its fitness for the purpose when grown, its natural ability to stand the hard conditions of the street, and its native longevity. A street tree should be expected to serve for generations. With the right tree chosen, as few know how to plant it properly or give it the after care wisely. The proper pruning, cultivation, prevention of damage by disease and insect pests, all require trained expert work. It is as absurd to leave the important feature of the beautification of the streets of our cities to the management of those who chance to live or own property along their margins, as it woudl be to turn over to these people the making and maintenance of the adjoining sidewalk.

And yet this has been so long and generally the custom, that it is no easy matter to correct the mistake. Few of us who have taken pains to plant trees and care for them on our own frontages, but would wince at a public official taking them in hand. This probably is the most serious obstacle in the way of municipal control where considerable attention has been given to trees and other street adornment by individuals. When the street trees of Riverside were turned over to me six years ago, this was the most difficult problem I had to meet. In many sections of the city there were many well-planted, well-cared for isolated sections of streets. Naturally, those who had gone to the expense and labor of making these improvements objected to their being taken out of their hands. This I fully appreciated and at once gave special permission to such parties to continue the care of their frontages, except in cases where it had been radically objectionable to the general interests of the street. Within three years, I was requested in nine-tenths of such cases to take charge of their trees. And now I seldom have any trouble from this source. Almost unanimously our people, not only acquiesce in the city control of the trees, but think it the wisest plan.

On unplanted streets, at first, it took much patience and caused no little trouble to secure consent to plant suitable trees, property owners often having decided notions as to what they wanted or did not want planted, and sometimes insisting on varieties utterly unsuitable. While this consent was not necessary, it was better to secure it where possible than to proceed in an arbitrary manner, even if it occasioned some delay in planting.

The general interest in street tree planting and care is largely a matter of education. Many have been accustomed to live on and traverse streets bare of ornamentation for so long that they think little about the effect different varieties would have when planted. But it is wonderful how quickly a community becomes interested in street trees when the planting is once done and more wonderful how quickly it leads to the ornamentation of adjoining private grounds and to additional ornamentation of the parking spaces by lawns or flowers. We have hundreds of well-kept lawns on parking spaces, frequently continuing unbroken for entire blocks and hundreds of private yards covered with fine lawns where, when the tree planting commenced, there were but bare dirt surfaces on the yards and margins.

Now, if these premises are correct, it seems to me that there remains no further occasion for plea for the need of some one in every city, thoroughly acquainted with trees and their planting and care, some one adapted not only by training, but by temperament fitting him to deal with people, and with a genuine love for the work to take charge of its street ornamentation, just as the trained road man takes charge of road building and repairing.

A word as to the name of such official. The common designation "Forester" is an euphonious term, but seems to me misleading. I can not see that the duties have any connection with forestry. The man who undertakes the job will find it no sinecure, but a most exacting, constant, severe caretaking of an important feature of a city's property, and I think the homely old term "Tree Warden," "Tree Caretaker," most nearly expresses his duties. But where are the men of suitable fitness for this important work to be found? This at present is probably the most serious problem in the systematic beautification of our cities.

When in the East, looking into this matter of tree planting, I was repeatedly told that finding the man with the right training and general fitness was their greatest trouble. At that time an effort was being made to have established at Yale University a department especially for the training of young men for this work. If the present interest in city beautification in Southern California continues and extends to other parts of the state, as I feel sure it will, I believe it need not be long before we may have such a department established at our state university. In the meantime we must do the best we can. One thing is very certain, money alone will not bring the service needed. There must be enthusiasm and adaptation to the work.

Hence we must depend largely upon the public spirit of men who are willing to sacrifice something of their own

A farmer at Colfax, Washington, has been seriously poisoned by handling of large quantities of grain poisoned with phosphorus.

time and effort with little or no remuneration, in getting the work properly started and carrying it on till especially trained men can be secured. We have a good example of what I mean in the case of the honored president of our Arboriculture Association. Mr. Pentelow's home is in Corona, a vigorous, pretty town in one of our best citrus fruit centers. In its early days many street trees were planted, but in late years no attention had been given them and few new trees planted. The old trees became in very bad shape, a disfigurement rather than an ornament to the streets. Through Mr. Pentelow's urgency, supported by active women's clubs, an effort was made to have the city assume the planting and care of street trees. The city council finally agreed to pass the desired ordinance, provided Mr. Pentelow would take charge of the work. This would necessitate a severe burden to be imposed on a man of his age, besides taking the time needed in his own affairs. But Mr. Pentelow's love for his city and appreciation of the need of something done for its beautification prevailed. He accepted, was appointed tree warden and given full control of the neglected trees. His intelligent work has already materially changed the appearance of the place and Corona will soon be one of the beautiful cities of Southern California. All this work has been and is being done without remuneration. But it is greatly appreciated and has secured a public sentiment that will assure it permanency. I believe that it is in this way that the work of systematic tree planting and care will need to be started in many of our smaller cities, if not in the larger ones. I can think of no better service that a man can render to his town than by organizing a work that will eventually make it generally, conspicuously beautiful for the present and for generations to come.

County Forester.

There are two very important things to be secured by a properly equipped county forester. Intelligent tree planting along our highways would not only relieve their monotony and add immensely to the pleasure of travel, but would have immediate and important influence on the beautification of the adjoining country home premises. It would arouse interest in farmers' families, and proper advice could be given as to how most effectively to beautify their frontages.

Again, in many of our counties, large areas of eucalypti are being planted with widely differing results, because of different management. It has been my conviction from the first that the forester fitted for his business would be of enough value to the county by judicious advice in this eucalyptus planting to pay for his salary many times over. The great fear is that the position will be sought for the salary by those not fitted for the service. But, however important this county work may be, and no one appreciates its importance more than I, it occurs to me that it may be wise to largely concentrate our efforts on securing proper tree planting in our towns as generally as possible and then we will be better prepared to urge it in the counties.

The United States Department of Agriculture has just issued a bulletin entitled "Irrigation in California," by F. W. Roeding. It is one of a series of reports dealing with irrigation in the arid states and territories, and was prepared for the purpose of answering inquiries regarding irrigation conditions in California and the opportunities and cost of settlement. The work on this report was done in cooperation with the State of California, and includes a general description of the climate, industries, water resources, lands, products, history of irrigation development, water laws, irrigation enterprises, and the cost of preparing land for irrigation.

The above report is known as Office of Experiment Stations' Bulletin No. 237, and may be had without charge as long as available upon application to the Secretary of Agriculture, Washington, D. C., or to United States Irrigation Investigations, Berkeley, Cal.

Roseville is making an effort to secure a viticultural experiment station.

Makes Buildings 30° Cooler

On a hot day the temperature in the upper part of a building will be from 15 to 30 degrees cooler when covered with J-M Asbestos Ready Roofing than when covered with any other roofing—the exact difference depending on what the other roofing is.

You can easily prove this. Place two thermometers on a board, as illustrated, and nail over them the roofings you wish to test. Lay these in the sun for an hour and then note the difference in the thermometers.

J-M Asbestos Roofing

keeps a building cool because its white surface reflects the heat and because of the great insulating quality of the *Asbestos* of which it is principally composed. Asbestos, you know, is used as a covering on about all the pipes carrving steam, etc., in the world to prevent heat escaping.

Due to its stone (Asbestos) construction, this roofing is also absolutely fire-proof, rust-proof, rot-proof and acid-proof. And, like all stone, it never needs painting.

It is suitable for all kinds of buildings, in any climate. Comes all ready to lay.

Your dealer sells J-M Asbestos Roofing—if not, we will supply you direct.

Write our nearest House for "large" sample to test and handsomely illustrated Book No. P 55 We'll also include sample of the curious Asbestos Rock

Deciduous Fruit Culture

THE APPLE ORCHARD.

Of the great beauties of the farm,
The one that has the foremost charm,
The apple orchard leads them all,
From early spring to latest fall.
The budding trees of pink and white—
The whole world shows no fairer sight.
An apple tree's full bloom will stand,
Beyond all rivals, broad and grand.

The honey bees, rejoicing, find
Its blooming sweetness to their mind.
They come from far, they come from near—
The early harvest of the year.
At length the baby apples show
Amid the green leaves, growing slow;
A promise of a tempting treat,
Which rain and sunshine kindly greet.

Those red-striped apples, tempting, rare—
No golden orange quite so fair.
Though tropic trees have long been mine,
For apple orchards still I pine.
That orchard to my childhood known
No tropic fruits can half atone.
The early bloom, the red-cheeked fruit,
Are visions which my dreams salute.
—Colman's Rural World.

STANDARDIZING OF FRUIT.

The deciduous fruit growers of the foothill sections and the Sacramento Valley were so abundantly satisfied with the standardization—or as Mr. DeMotte expressed it, "The honestization of pack," that the movement will be even stronger than last year. One of the prime movers in the effort has been Geo. D. Kellogg of Newcastle, Placer County. Mr. Kellogg sends us the following agreement and standard requirements as adopted this year as follows:

Agreement.

We, the undersigned, fruit growers and shippers, of Placer County, hereby agree for the term of one year to pack and ship only fruit according to the standards established by the mass meeting of May 11th, 1911, at Newcastle as per the standardization found below.

We further agree for one year, to abide by the decisions of the following board of five supervisory inspectors: Geo. D. Kellogg, Antone Fereva, W. H. Tudsbury, H. E. Butler and H. H. Bowman, or their successors, who shall serve without pay and who shall supervise the inspection of all fruit coming within this agreement, and employ all paid independent inspectors, to pass on the quality of such fruits.

This committee of five to be empowered to arrange for boards of three arbitrators for each of the various shipping points in the county to whom shall be referred all disputes arising from the inspection of fruit.

We further agree to become members of the Placer County Growers and Shippers Association, which organization shall in the future elect the above board of inspectors and assume the responsibility of working out and correcting the details of this plan and executing its provisions.

We further agree to bear our proportionate share of the expense of the inspection of fruit under this plan and the cost of labels used to label fruit conforming thereto.

We further authorize the collection by the committee of five, or supervisory inspectors, and the payment by the fruit shipping house to which our several crops of fruit are delivered, of a sum not to exceed one-quarter cent per box, which sum shall be used by said committee of five, or supervisory inspectors, to defray the cost of inspection under this agreement, the cost of labels to designate fruit passing this inspection, and the necessary expenses incurred by the supervisory inspectors. Any surplus in this fund to become common property of the association.

Standard.

Cherries. All cherries must be in perfect condition, the right degree of ripeness and color, neatly packed, double faced, square method of facing instead of the diamond pack, with corners of boxes reinforced or well supported so that the box will be full and the surface unbroken, no stems showing on the top or bottom of the box. Cherries packed all through the box, in perfect condition, or what is sometimes called 4-tier may be designated as solid pack. Cartons, 4, 5 and 6-row admissible.

Grapes. Grapes of standard pack shall be fully matured, carefully picked, properly trimmed, wilted at least twenty-four hours before packing, neatly packed in regular baskets, four baskets to a crate, the crates to be 4¼ inches deep, with an 11-16th in. cleat under the cover; no stems in sight; weight to be not less than 26 pounds; depth of crate not to exceed 5 inches inside measurement.

Plums. Plums are to be packed in crates with four baskets, two or three tier to the basket with not more than five by five in each tier and every tier uniformly numbered excepting Royal Hative, Clyman, Tragedy, Red June, Botan and kindred varieties which may be packed five by six; with the exception also that Climax, Wickson and Kelsey must be packed not smaller than five by five for the top two tier and four by four on bottom of basket.

Apricots. The grading of apricots will be governed practically by the same rule as applied to plums.

Pears. Pears shall likewise be packed with neatness and uniformity. Four or five tier to the box, free from worms, bruise or defect; no pear to be less than 2¼ inches in diameter for five tier, and 2½ inches in diameter for four tier; to weigh not less than 50 pounds to the box. Half boxes may be packed with three tiers, no pears to be less than 2¼ inches in diameter; to weigh not less than 25 pounds. Covers of the box to be sprung. (Sugar and Seckle pears not to come under the above rule.)

Peaches. For peaches the grades are to run as follows: 60 and larger, 72 and larger, 84 and larger and 96 and larger to the box, for all except Triumphs, Imperials, Alexanders and St. Johns; for these 105 and larger to the box would be permissible. All must be of sufficient degree of ripeness, evinced by proper color, and package to present a neat and uinform apearance, the pack free from worms, bruise or defect. THE BOTTOM AND TOP LAYERS MUST CONSIST OF THE SAME NUMBER AND SIZE; sides of boxes to be sprung.

Triumph, Alexander, Hales Early, Early Crawford and Hull's Late free smaller than 96 to the box, if sound of good color and flavor and uniform in size, may be packed in three tier crates, four by four in each tier. Each box shall be designated as to its contents by stamping upon the box the number contained therein, thus: Peaches—60—72, 72—84, 84—96, 96—105, and three tier, as the case may be. Pears—four tier or five tier or ½ box. Cherries—9 rows, 10 rows, 11 rows, 12 rows, Solid Pack or Cartons, 4, 5 and 6 rows. In all packing of fruits standard boxes to be used only. These regulations apply to good fruits for interstate shipments only.

APPLE EXPORTS AND THEIR LESSON.

Referring to the season's shipment of apples and some facts worth remembering, a letter from W. N. White & Co., fruits and general produce, says:

"This week will about wind up the exports of apples to Europe, and the following figures of exports in barrels may be interesting and instructive:

	This Year.	Last.
Port of New York	326,219	398,944
Port of Boston	440,926	263,626
Port of Portland	72,807	248,020
Port of Montreal	169,940	587,287
Ports of Halifax and Annapolis	204,254	676,424
Port of St. John	5,055	45,356
Boxes of Far Western	1,070,500	463,362

"The early spring and late frost destroyed large portions of the crop east

STAR Portable Drilling Machines

They're Still Running

of the Rockies and in many parts of Colorado. New York kept her supplies up to the average through drawing large lots from the Virginias, where they have gone into extensive planting during the past decade. It will be seen that Boston and Portland combined are about equal for the two seasons. From our own observation, Massachusetts and Connecticut, that were for many years a by-word among fruit suppliers from other states, will in the future have to be reckoned with. Growers there are taking more pains with their orchards, until today the quality is equal to some of the best in New York State.

"Attention is called to the falling off from Montreal, Halifax and St. John of over 800,000 barrels. Last year's warm March, followed with bad weather in May, accounts for this. Otherwise, Nova Scotia alone, with her increasing acreage, expected 1,000,000 barrels. This year things are reversed. They still have cold weather, and their season is fully four weeks later than last. It is said their trees are looking well, and, having had light crops last year, Canadian ports are expected to ship this year 2,000,000 barrels, or 700,000 more than two years ago.

"Further attention is called to the remarkable increase in far-western boxes, the largest in any previous season exported being 520,000 boxes. This industry started in 1885, and my firm sold the first car that ever was shipped to England. The total output this year has been reckoned at about 15,000,000 boxes. Each box when sent to New York pays the railway 50-cent freight. At the present time everything West looks well for good crops. Colorado, that only had 2,500 carloads last season, has already come out with the statement that they expect 10,000 this season. This would mean 8,000 carloads of apples (6,000,000 boxes). The immense tracts laid out in Idaho, Utah, Oregon and Washington during the past ten years, which are now coming into bearing, look like 28,000,000 to 30,000,000 boxes next season, and it remains to be seen if these quantities will be able to stand the present railway charge.

"All barrels of apples have sold at good prices, but boxes have sold at lower prices than they have in their history, particularly those grown under irrigation. Some of these have arrived in Europe in bad condition, proving that fruit grown under irrigation has poor carrying quality—too much water in the fruit; and as the American government is expending some $25,000,000 on irrigation, this season's lessons may be of some value. We are continually being asked about fruit growing in the West by parties who have read glowing descriptions of the real estate dealers. We trust they will be able to draw their own conclusions from this report.—Journal of Commerce.

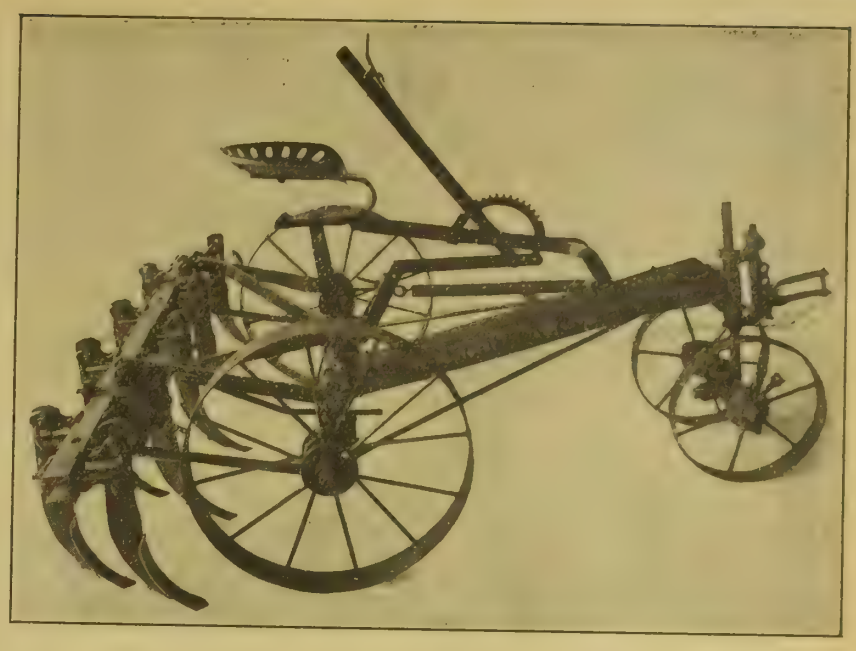
IRRIGATION AT POMONA.

The United States Department of Agriculture, in co-operation with the State of California, has just issued a bulletin on "The Use of Underground Water for Irrigation at Pomona, Cal." The work was prepared by Mr. C. E. Tait, irrigation engineer in charge of the work of irrigation investigations in Southern California.

The Pomona Valley is typical of localities in the citrus belt in the southern part of the state, where water has a high agricultural value and can be secured only at high cost. Much of the water is pumped, and there is no other section where it is used more economically or where greater effort is made to improve methods of development, distribution and application. This report describes the problems confronting the irrigators, the methods employed, and the progress made in the economical use of the water resources. It is believed that it will be of value as suggesting further progress in both Southern California and in other regions.

The report is known as Office of Experiment Stations' Bulletin No. 236, and may be had without charge as long as available upon application to the Secretary of Agriculture at Washington, or to United States Irrigation Investigations, Berkeley, Cal.

Ukiah will soon build a mammoth winery.



The Arnott Improved Orchard Cultivator

WE are pleased to be able to announce that prompt shipments can now be made of the **New Arnott Cultivator** as shown above. This has been for years the most popular cultivator in the Southwest and with the **New Fore Truck** it is way in advance of any other orchard tool.

Mr. Vestner says:

Jacinto, Cal.

Sacramento Valley Irrigation Co.

Gentlemen:—I own sixty-five acres of land on the Jacinto Unit. I started my dairy business five years ago with thirty common cows. I have improved the herd by breeding and grading until now the herd is almost pure Jersey.

I keep an average of 150 hogs and about 150 chickens. From these chickens we sell from $20 to $30 worth of eggs per month. I raise everything I feed on the ranch. Dairy cattle are getting nothing but alfalfa. It costs about $30 per head per year for feed. The average price on loose alfalfa in the field has been about $7 per ton for five years. Irrigated land in the Sacramento Valley cannot be beat for dairying. Alfalfa irrigated here ten days ago is now fourteen to sixteen inches high and will yield over one and one-half tons per acre. We cut alfalfa six times besides using the fields for pasture. We raise all the vegetables, butter, eggs, etc., that we use and have an orchard and vineyard that are doing fine.

Yours truly,
(Signed)
C. A. VESTNER.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

CARE WITH MILK AND CREAM.

It is to the everlasting interest of the dairyman to see that his creamery produces only the best product. Whether the creamery is co-operative or buys outright of the producer is of but small moment. Ultimately the loss or gain comes at least in a measure back on the producer.

One thing is absolute, if the producer of the cream is slovenly or careless the creamery can never produce a first-class article.

Mr. J. P. Murphy, manager of the Dairymen's Co-operative Creamery at Tulare, in his desire to have the fullest co-operation of his members writes them as follows:

"A large number of our patrons are skimming their cream too thin. No cream should be sent to the creamery in the summer time especially, that does not test at least thirty-five per cent., and should be forty per cent. in warm weather. Some of our patrons are skimming their cream at a test of forty per cent. and taking care that it arrives at the creamery in first-class condition. These dairymen are a credit to the dairy industry and deserving of better prices for their product. If the proper results cannot be obtained from all the patrons in the near future the creamery management will be compelled to pay a lower price on thin cream and cream that has not been well cooled and cared for.

"You need the skim milk for feeding purposes and it is a loss to you to send it to the creamery. Twenty-five or thirty per cent cream does not make an exhaustive churning, that is, more of the fat goes off in the buttermilk—here you lose again. Thin cream contains a much larger percentage of bacteria than rich cream as the bacteria is in the milk and not in the fat.

"Butter made from thin cream is of inferior quality and brings less price than from cream handled in the proper manner. All cream should be cooled as soon as possible after separation and the proper results may be obtained by adopting the following rules: See that your separator is in good condition. Keep the speed up so that it will skim clean. Keep the flow of milk the same from start to finish. Set the cream screw so that you will skim between 35 and 40. The surroundings and general conditions of the dairy must be sanitary. The tinware and separator must be washed thoroughly and well aired each time after using.

"On going to milk in the evening cold water should be pumped—enough to fill one can—this cools the can and when the first pail of milk is ready to be strained pour the water into another can and strain the milk into the cool one. The cans should be placed in the shade and wet sacks put around them, if possible. When ready to separate the milk, pump more cold water into the can which is to receive the cream. By the separator have a half barrel or tub with a rack to hold the cream cans straight. Partially fill this tub with cold water and as the cream fills the can it will settle down into the water; then have a small pulley at the top of a pole or on a tree; put a stout cord through this pulley with two hooks on the end of the rope—these hooks fasten in the handles of the cream can. Put two well-soaked sacks around the can and haul it up to the pulley—thus raising it away from the heat of the earth to an elevation where the air is circulating freely, causing a rapid evaporation. The water evaporating carries away the units of heat from the cream, leaving it in good condition. In the morning the can of cream should be lowered and placed in a sack cooler, which everybody should have. When the morning's cream is separated then a wet sack should be put around each can and taken at once to the creamery.

"Now as a dairyman who is in the business for the money can you afford to go on losing day after day? Will you see to it at once that your cream comes to the creamery testing above 35 per cent of fat, well cooled and clean, or will you compel the directors of your creamery to set a lower price on your cream because it is not worth as much as that of your neighbor?"

A COMMON AILMENT OF FOALS.

The first fortnight or three weeks is a critical period in the life of a foal. At this tender age, when least capable of offering resistance, it is especially liable to be overtaken with accident and disease. As regards disease, derangements of the digestive system are, perhaps, the more common ailments, but the mortality from respiratory disorders, the result of cold, and blood poisoning as the consequence of exposure to filth, are very much in evidence, even in some of the best and most fashionable studs. Experience shows that the prevalence of these affections can be largely curtailed by care and foresight. This is seen in the difficult results which attend the management of different studs in respect to their sickness and mortality.

Constipation is of common occurrence at the time of birth, although no solid food has been taken during the foetal life of the foal. The intestines always contain a certain quantity of what is known as meconium. This is a yellowish-brown or greenish-brown substance, which is the solid residue of the secretions formed in the bowels and the liver in the course of gestation, and which is normally discharged by the foal soon after birth.

It is a practice with some breeders to anticipate constipation by administering to all foals a dose of castor oil soon after birth, but the disagreeable consequences which have resulted in the writer's experience from this custom does not warrant its adoption; for in those cases where the bowels are relaxed at birth a dose of oil may be the means of provoking fatal diarrhoea.

Early foals whose dams have lived in confinement on hard food are more liable to this affection than are those of mares who have had a succulent diet. Under ordinary circumstances, foals will empty themselves in the course of two or three hours after birth. Should they not do so, an enema of milk and warm water in which a little soap and glycerine has been dissolved should be given and repeated in a short time, if necessary. If there is no response and the foal shows restlessness by straining, whisking the tail or looking backward toward her flank, a dose of castor oil should be given. If after this, the bowels do not act, there is need for professional assistance. — Coleman's Rural.

SCIENTIFIC STOCK-FEEDING.

Under the direction of Prof. T. L. Haecker, the Division of Animal Husbandry at the Minnesota University Farm is carrying on a series of experiments which are expected one day to furnish to the stockraisers of the Northwest an invaluable guide for the feeding of beef cattle, so as to secure the largest, most steadily-progressive gain in weight from the amount of feed given, and at the smallest proportionate outlay. A system of minute observation and recording has been adopted, similar to that which, carried on for fifteen years, enabled Prof. Haecker at last to formulate a table of rations for dairy cows, the systematic use of which is today enabling dairymen to secure far larger returns, in milk and butter-fat, from cows of whatever breed, than was before deemed practicable.

Commencing in 1907, a certain number of calves have been bought each year, and fed "from birth to block," in such a manner that the effects of different combinations of feeds are made apparent. Every mouthful of feed is carefully weighed, and the proportion of each ingredient in the day's ration noted. This work is to be carried on until the observers shall know

exactly what and how much food it requires to produce a certain gain in the period from birth to any given time in the steer's life. The element of chance will thus be practically eliminated from the stock-raising industry, so far as the production of beef is concerned; to eliminate it from the marketing is another question!

One thing is already demonstrated: that the cattleman who fattens his animals "from birth to block" has a much better chance of satisfactory returns than he who sells half-grown feeders for some one else to "finish" for marketing. The latter turns over to the stockyard men, to feeders and the railroads a very large share of the profits which might have been his.

EDUCATIONAL BUTTER SCORING CONTEST.

By Leon M. Davis.

Report of Third Entry, third year, scored May 30, 1911, at the University Farm, Davis, California. Highest score 94, obtained by Suisun Creamery, Suisun, California.

In response to the call for third entry of the 1911 California Butter Scoring Contest, twenty-eight creameries responded, which is the largest number of entries sent to a single scoring since the contest began in 1909. Such a general renewal of interest in the work is encouraging, and it is to be hoped that all the participating butter makers will continue to lend their support to the remaining three scorings of this year. Mr. W. B. Thurston, dairyman in the U. S. Division, directed the scoring, being aided by members of the Dairy Department.

The scores placed were as follows:

Creamery—Location	Score
Suisun Creamery, Suisun	94
Salinas Creamery, Salinas	93½
Univ. Farm Creamery, Davis	93½
Laton Co-op. Creamery, Laton	93½
Grizzly Bluff Cry, Grizzly Bluff	93½
Castroville Creamery, Castroville	93
Glenn Co. C. S. & Cr. Co., Willows	93
Cal. Poly. Sch. Cry, S. L. Obispo	93
Cottonwood Cry., Cottonwood	92½
Elk Grove Cry., Elk Grove	92½
Visalia Co-op. Cry., Visalia	92½
Santa Ysabel Cry., Paso Robles	92
Riverdale Co-op. Cry., Riverdale	92
Delta Creamery, Imperial	92
Elkhorn Creamery, Sta Barbara	92
Dairymen's Co-op. Cr., Tulare	91½
Eclipse Creamery, Beatrice	91½
Meridian Cry., Meridian	91
Lampenheim Cry., Hardwick	91
Pozzi Creamery, Marysville	90½
United Creameries, Arcata	90½
Elite Creamery, Nicasio	90½
Stanislaus Creamery, Modesto	90
Ceres Creamery, Ceres	90
Bridgeport Creamery, Manchester	90
Standish Creamery, Standish	90

The butter on the whole represented a better lot than was received at the April scoring. That the buttermakers had put forth their best efforts was noticeable under all points on the score card, even under package. Most of the boxes were very carefully made, and indicated that pains had been taken toward a neat, attractive cube. Paying attention to this detail usually follows careful attention to all those points which the buttermaker has under his control in the manufacture of good butter.

It was necessary to cut but two cubes for defective salt, these being very high or gritty. Many of the entries were slightly low in salt, especially when most markets will stand 2 per cent. The low salt content of these entries was possibly responsible for a flat flavor which was prevalent, the general criticism of the judges on flavor being a "light flavor," or lack of desirable delicate butter flavor." In contrast with the previous entry, very few pieces showed any marked evidences of feed flavor, and such would not be expected so much at this season. A few cuts were made under body, due largely to faulty temperatures. Most of the entries arrived at the University Farm in time to have the advantage of at least thirty-six hours hardening in the refrigerator room, and when scored were in excellent condition. Several cubes were shipped in iced boxes.

With an occasional exception, the buttermakers taking part in the contests are doing remarkably well in view of the raw product with which they have to work, and the lower scores must be charged to those of their patrons who will assume no responsibility in the production of good cream. The few creameries in the state which are grading have made a wise step, and, sooner or later, their example must be followed by all.

A New Book and a Good One

The Story of the Soil

By Cyril G. Hopkins

"A lobe tale threading a substantial fabric of important facts about the soil"

I must say that I think the book is destined to do more good, stir more thought, encourage more upward effort among the farmers of this country than any other publication that has yet appeared. It was a happy thought making a human story of it.—Ex-Governor W. D. Hoard, Ex-President Board of Regents, University of Wisconsin, Editor of Hoard's Dairyman, Fort Atkinson, Wisconsin.

I enjoyed every word of it. It is fascinating. I doubt if a dozen people in the country would believe that it is possible to write a novel about the soil—these big soil problems handled so ably, so plainly that any farmer can understand. Here is a book that certainly every man in the land should read.—Editor Charles W. Burkett, of American Agriculturist and of Ginn & Company's Country Life Education Series, Boston, Mass.

This book is the greatest work of fiction based on agriculture ever written. The narrative contains a storehouse of information that will be worth millions to the farmers of America. Read this story; it is worth its weight in gold.—Burridge D. Butler, Publisher of the Prairie Farmer, Chicago, Illinois.

12 mo. 350 pages, handsomely printed with clear type on heavy wove white paper, well illustrated, strongly and durably bound. We offer this book, postpaid, in connection with 1 year's subscription to the California Cultivator, for $2.35. Book alone, $1.50.

Small Fruits and Vegetables

CUTWORMS.

By S. Arthur Johnson, Colorado Agricultural College.

Cutworms do the most injury in the spring. Their ravages are most noticeable in gardens and wheat, although they often attack beets, and in fact, any green vegetation. They receive their name from the habit they have of cutting off plants just below the surface of the ground.

Cutworms are rather plump and sluggish and have the habit of curling up when touched or exposed to the light of day. The color is dull green, or greenish brown, with two broad, irregular stripes of somewhat lighter color extending down the back. They are night feeders altogether, and the farmer's crop slowly disappears while he sleeps. During the day they hide in the ground at a depth of about an inch, or under some protecting shelter, such as a board, clod of earth, or cow dropping. Here they may often be found, and if they are very numerous in the fields, search in these places will almost surely reveal their presence.

The worms, in early spring, are about half-grown. They hatched the previous fall from eggs which were laid on vegetation during September and October. While young they attracted little attention. They hid during the day; food was abundant, and they ate comparatively little during the early stages. During winter they lay buried in the earth.

When the warm spring days arrive, they come to the surface of the ground and eat ravenously. Just at this time the farmer plows under the abundant vegetation, which was their food supply, and plants in its stead a scanty crop. Injury to the young seedling crop is all the more disastrous because the destruction of each tender plant means a serious loss later in the season.

The damage continues till about the latter part of May, when the worms are full fed, and retire about two inches below the surface of the ground to transform in earthen cells to brown pupae. In about a month the moths appear, and when numerous, cause considerable annoyance by flying into the houses and darting about the lamps. These moths measure about two inches from wing tip to tip. The ground color of the upper wings is blackish brown, with lighter markings. The under wings are lighter in color with darker edges.

A second brood of worms occurs in late summer, but the damage done at that time is not often of serious proportions.

Under field conditions, prevention is the best of remedies. Where the ground is plowed in August or September, and kept free from growing vegetation, the rest of the season there will be no damage from cutworms except possibly on the margins of the fields. In the Canadian wheat fields arsenic bran mash has been used with success. This is the most effective when applied before the sprouting grain appears above the surface.

The formula is as follows:

Paris green	½ pound
Bran	50 pounds
Syrup	1 quart
Water	2 gallons

Mix the Paris green and bran till the color is even, then stir in the syrup and water, making a crumbly, but not sloppy mass. Scatter this mixture thinly over the fields during the afternoon and early evening. In wheat, from thirty to fifty pounds per acre may be used, but in more valuable crops it will pay to use two or three times this amount. White arsenic may be substituted for the Paris green with good effect, but this poison is very hard to see in the bran and it is difficult to obtain an even mixture.

Poisoned bait made by cutting green alfalfa or clover and dipping this in a pail of water, to which a spoonful of Paris green has been added, works well where small areas are to be protected. This bait is distributed in small handfuls every few feet during the latter part of the day. Often it is advantageous to spray very thoroughly a patch of growing weeds or grain, then cut the bait and distribute it. Potato patches have been successfully protected by spraying the vines with Bordeaux mixture to which Paris green has been added.

Under garden conditions other methods are often available. Surround each cabbage or other plant set with a collar two or three inches in diameter. These may be made of pasteboard or stiff paper and should be about two inches high and thrust into the ground to the depth of about an inch. Old tomato cans from which the tops and bottoms have been melted are excellent for this purpose and may be used year after year. Sometimes boards or cabbage leaves are laid out as traps. These are lifted each day and the hiding worms killed.

When cutworms infest seed beds they may be controlled by spraying the young plants with Paris green and water, at the rate of one-half pound of the poison to fifty gallons of water.

CABBAGE APHIS.

By J. E. Mundell, New Mexico College of Agriculture.

The cabbage aphis or louse is one of the worst pests the grower of this crop has to contend with. This aphis is a sucking insect and must be combated with a contact spray. It is of a bluish-gray color, of an oval shape, being a little larger than the head of a common pin. They make their appearance in early summer on the plant, and are usually found on the under surface of the leaves. Their presence on the plant may be easily detected by the edge of the infested leaf curling up.

The aphides live in colonies, and multiply very rapidly. Unless checked they soon spread over the entire plant and either kill it or cause it to head very poorly.

Remedies.

There are quite a number of remedies recommended for use against the aphis. The Horticultural Department of the New Mexico Experiment Station has used several of these remedies, and has found some of them to be both practical and effective. They are used as follows:

Kerosene Emulsion.

Dissolve ½ pound of laundry soap in 1 gallon of hot water. Then add, away from the fire, 2 gallons of kerosene. Churn this mixture until white and of the consistency of cream. After the oil and soap have been thoroughly emulsified, add 25 gallons of water, and apply as a spray or with a stiff paint brush or swab. It is important that the mixture be thoroughly emulsified. On indication of injury to plant, dilute the emulsion with more water.

Whale-Oil Soap.

Dissolve 2½ ounces in 1 gallon of hot water, and apply while still warm, as a spray or with a stiff paint brush or swab.

Tobacco water is used frequently as a remedy for plant lice. Boil for half hour 1 pound of tobacco dust or stems in 1 gallon of water, and use as a spray or wash without diluting.

Tobacco dust is also quite effective for combating cabbage lice. This dust is applied with a bellows blower, or may be shaken on the plant with a pepper box. The blower gives the better results of the two, as it puts the material on with more force.

Hot water or strong soap suds heated to a temperature of 130 to 140 degrees Fahrenheit may be used effectively against these insects. The hot water or suds applied as a spray or with a brush at the above temperature will not hurt the plant, but will kill the lice.

In using any of these remedies, promptness and thoroughness in applying will count a great deal. On the first appearance of the insect the remedies should be used, and applied a second time, if necessary.

In regard to the cost of the materials for the different remedies, it will depend on the quantity purchased at one time. The tobacco dust costs 3½ to 10 cents per pound; whale oil soap 8 to 15 cents. These insecticides are carried in stock by most of the seed houses.

Bees and Their Care

DEPUTY BEE INSPECTORS.

By Chas. C. Shubert.

I believe that a thorough system of inspection of the apiaries and subsequent control and final eradication of foul brood from the bees, the safeguarding against spread of black brood, which has made its appearance in some districts of the state, concerns the beekeepers about as much as any one subject in apiculture. Localities which are free from these diseases should be protected. And in places where foul brood is almost general in the apiaries, the most efficient system of inspection with rather radical methods of treatment carefully carried out, are required to get and keep control of the disease. Once this is accomplished eradication may be hoped for in the course of several years.

A system of inspection and treatment should be carried on in such a way as not to interfere with the beekeeper's crop of honey for the season any more than is necessary. Now the question arises how to best accomplish these results. The past I believe, has demonstrated that the present system is unsatisfactory. I am of the opinion that from a practical standpoint no efficient inspection and eradication of foul brood can be accomplished under tne present law.

So let us take the liberty of assuming that there is a chief inspector of apiaries either county or state, with an efficient corps of deputies, whose duty it shall be to cause inspection of all apiaries, and bees under his jurisdiction, especially in those localities where bee diseases are known to exist.

It seems to me that the most practical way to gain control and eventually eradicate the disease is a judicious system of inspection through field worker deputies. This work should be done early in the spring when there is not much brood and few bees in the hive and the supers are light. The greatest amount of work can then be done with the least expenditure of money and time. Also the disease can more readily be detected.

For instance, take Los Angeles county. While our county inspector is engaged in traveling from one end of the county to the other inspecting an apiary here and an apiary there, the deputies could be doing good work inspecting not only an occasional colony, but every colony and every brood comb in every colony. This is absolutely necessary in a locality affected with the disease.

The deputies being on the ground would constantly have a general supervision over their territory.

I have in mind a locality of nine apiaries of say 1600 colonies of bees. Perhaps each apiary has more or less foul brood and several of them are badly diseased. The county inspector comes along about once a year, makes a hurried inspection of two or three easily accessible apiaries, finds foul brood, instructs the beekeeper to clean up and away he goes, perhaps to the other end of the county. In order to do thorough work here every brood comb in every colony should be inspected in these nine apiaries.

If the bees are in modern hives, a deputy with the assistance of, the owner of the bees should do the work of going through the 1600 colonies in ten to twenty days.

The expenditure in railroad fares, hotel bills and livery bills that are necessarily incurred by the inspector from a distance, to say nothing of the time consumed in hunting up bee ranches, is money and time used that could be directly applied to the actual inspection of bees by deputies.

On more than one account it seems well worth while that a woman should not only be able to help in some particular department of bee keeping, but that she should have a good general knowledge of the whole business.—American Bee Journal.

TREATMENT OF FOUL BROOD.

While I do not desire to invite unprofitable discussion concerning foul brood, it does seem to me that there should be a systematic method agreed and acted upon in unison by all bee keepers who suspect that they have this very destructive ailment among their bees. I have special reference to the matter of diagnosis, for until the bee keeper is absolutely certain as to which form of disease his bees are infected with, he is quite liable to treat for black or European foul brood as the American form must be treated, or he may treat the American foul brood according to the Alexander method of treating the black or European form, which method never did, and never will, rid an apiary of American foul brood. In making this sweeping declaration I speak from experience.

I had in my apiary what I confidently felt was American foul brood, judging from the offensive odor from the hive, and the ropy character of the dead larvae. Other bees in this county were infected with the same ailment, and when I called upon our county inspector to look after and stamp it out, one bee keeepr stated that it was not foul brood, and threatened to prosecute me for circulating such a report, assigning as a reason that I was doing him a very great injury by so reporting. I at once sent a sample to Dr. E. F. Phillips, at Washington, D. C., who very promptly notified me that I had a typical case of American foul brood, which report put to rest the character of the malady.

It being understood that nothing short of a removal of both the combs and honey from the hive, and putting the bees upon new comb foundation in clean frames, would eventually stamp out the disease, this method was adopted, and in a short time we got rid of the pest. It is proper that I should state further that in most cases the bees were put on narrow strips of comb foundation for two days, and then on to full sheets of foundation.

In the treatment of European or black foul brood the destruction of neither comb nor honey, it seems from reports, is necessary. Simply remove the queen and leave the colony queenless twenty-three or twenty-four days, then give them a virgin queen; and some say at the same time make the colony strong in numbers. The cure is regarded as complete. Thus it will be seen that there is no removal or destruction of either combs or honey.

But an amateur, or any bee keeper not familiar with either form of foul brood, is quite likely to mistake the American for the European, or the European for the American form, and in case of success in stamping out the disease, call it American foul brood when it is the European form, and thus unintentionally mislead many bee keepers. When a sample of the diseased brood is sent to Dr. Phillips for microscopic inspection, it would put the bee keeper on the right road to success and avoid the publication of misleading reports. To do this is no hard task. Dr. Phillips will gladly send boxes and mailing cards upon application, and, moreover, it will cost no postage to send samples.

In one instance I put an infected colony on comb foundation, and after some twenty-one days found the bees in excellent condition, and, feeling anxious to help them, I gave them a comb from the infected hive I had taken away from them, it being, from all external appearances, free from anything of an infectious nature; it contained a few cells of sealed honey and no unsealed honey that I could discover; but the experiment was a costly one, it being only about two weeks after giving them the comb referred to until foul brood showed up again, and it came from no other source. So do not give such combs to bees.—American Bee Journal.

DWARF KAFFIR CORN for DRY LAND
No better fodder and grain crop can be planted on dry or alkali and than this prolific member of the Sorghum family. This dwarf variety possesses the advantages of more foliage, smaller stalk and ease of harvesting. Its great root system enables it to produce wonderfully in drought sections, and breaks up new ground for other crops.
FOR STOCK FEEDING
Dwarf Kaffir Corn will produce 10 to 15 tons of green fodder or silage to the acre, or 5 to 8 tons of dry fodder.
FOR POULTRY
The grain is a valuable food for poultry and will crop 2,000 pounds and upward per acre.

CONTENTS THIS WEEK

LEMON BLOSSOMS, Cover.
LEMON BLOSSOMS AND WHY THEY FALL OFF, 683.
NECESSITY FOR CITY AND COUNTY FORESTERS, 683, 684, 685.
DECIDUOUS FRUIT CULTURE.—The Apple Orchard; Standardizing of Fruit; Apple Exports and Their Lesson; Irrigation at Pomona; 686, 687.
LIVE STOCK AND DAIRY.—Care With Milk and Cream; Common Ailment of Foals; Scientific Stock Feeding; Educational Butter Scoring Contest; 688, 689.
SMALL FRUITS AND VEGETABLES.—Cutworms; Cabbage Aphis; 690.
BEES AND THEIR CARE.—Deputy Bee Inspectors; Treatment of Foul Brood; 691.
EDITORIAL.—Agricultural Books in Libraries; California Agriculturally; Slick Up; Pacific Coast Nurserymen's Association; Editorial Notes; 692.
AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast; 693.
PROFIT IN THE POULTRY YARD.—Sorrows of Others; Breeding Ducks; Epsom Salts; Weak Digestion; 694, 695.
QUESTIONS AND ANSWERS.—Geraniums Blasting; Bee Paralysis; Angora Goats; Container for Egg Preservative; Palm Seeds; Sulphuring Roses; Nitrate of Soda—Alkali; Sex of Chicks; Soil for Tomatoes; Ripening Lemons; Moles; Gum Disease; Erinose; Blossoms Dropping from Tomatoes; Plowing at Blossoming Time; Sulphur—Lime on Twigs; Time for Budding; Dying Watermelons; Removing Fruit; Ground Squirrel Eradication; 697, 698.
GENERAL AGRICULTURE.—Tulare Grange; 698
HOUSEHOLD DEPARTMENT.—Seed Time and Harvest; Mr. Bascom Goes Hunting; Mark Twain Said; 700, 701.
PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 702, 703.

We have a circular letter from the Riverside Public Library with list of recent additions to its shelves. Among these are several books pertaining to gardening and agriculture, and many documents, especially those from the Department of Agriculture, which are classified and listed. Many of these are such as would not be listed in the farmer's or fruit grower's library and should be appreciated by agricultural readers of that rich section. We believe this is a wise move on the part of the library management and a valuable hint to libraries in other sections.

CALIFORNIA AGRICULTURALLY.

From California's Agricultural Statistics, issued by the Bureau of the Census, we note as to rates of increase and decrease:

"It is pointed out in the statement today that the principal rates of increase in California in 1910, as against 1900, in the items for which percentages are given in the first section of the summary, are: In the expenditure for fertilizers, 128 per cent; in the average value per acre of farm land alone, 116 per cent; in the average value per acre of farm land and buildings, 112 per cent; in the value of farm land alone, 109 per cent; in the total value of farm land and buildings, 105 per cent; in expenditures for labor, 92 per cent; in the total value of farm buildings alone, 71 per cent; in the total value of all farm implements and machinery, 71 per cent; and in the whole number of farms, 21 per cent.

"The only decreases during the decade, among the items for which percentages are given, occurred in the average acres per farm, 20 per cent; in the total improved farm acreage, 5 per cent; and in the total farm acreage, 3 per cent.

"The statement shows in detail that the number of farms reported in 1910 was 87,670, as compared with 72,542 in 1900, an increase of 15,128, or 21 per cent."

One decrease is especially gratifying; the average acres per farm has been reduced 20 per cent. The decrease of 5 per cent in the total improved farm acreage, however, calls for explanation. This is due to discrepancy with the 1900 report, and is only apparent. Many acres of pasture were at that time reported as improved land but in the 1910 census were not so classified. This was largely in three counties, Merced, Orange and Sacramento. As a matter of fact, the improved acreage forms 41 per cent of the total acreage, as it did in 1900. The decrease of 3 per cent in total farm acreage is due to two causes, first to a similar error to the above mentioned, and next the land which has been incorporated within the forest reserves within the last ten years. In 1910 there were within the forest reserves of the state only 9,000,000 acres, while now there are over 28,000,000 acres, and included in this are some of the lands reported in the 1900 census as farm lands.

The total farm acreage of the state is now 28,883,000 acres; improved land, 11,380,000 acres. The average acres per farm is 318; in 1900 it was 397. The total value of farm lands, including buildings, is $1,448,560,000. Average value per acre, including buildings, is $51.95. Expenditure for farm labor was $49,735,000, as against $25,845,000 in 1900. The greatest advance seems to be in expenditure for fertilizers, 128 per cent increase in the ten years, the amount in dollars being $2,132,000, while in 1900 it was only $937,000. Of the total of 87,670 farms, 84,692 are owned by white farmers, and 2,978 are owned by negroes and non-whites.

"SLICK UP."

With nearly every municipality in the state discussing how it can make itself more attractive to the thousands of visitors who will tour the state during the two great expositions to be held in 1915, it is well for rural communities to swing into line with the same point in view. In some parts of the state there has been such a plan of roadside planting developed that Eastern visitors have involuntarily remarked on seeing them that "your country districts miles from town often show more taste than many streets in Eastern cities." Unfortunately, these conditions do not obtain the state over, and there are places where an awakening is needed. From a purely selfish standpoint it is wise to discuss the pros and cons of bringing every section up to its greatest possibilities of beauty. Some of the narrow minded acreage owners claim that beautified roadsides add nothing to the productivity of the farm. In this we do not agree, for while there have been cases of planting of pepper or eucalyptus trees along roadsides which have caused loss of moisture so that there has been a reduction in the productive power of the orchard or ranch, as a rule the "slicking up" of property frontage gives a feeling of pride which inspires better cultural methods within its boundaries, and better culture brings better financial returns. Another objection sometimes raised is that the assessor, noting the improved conditions, adds to the real estate valuation, and so the taxes are increased. We doubt it, but if it be true, we are going to set up the counter claim that improved conditions and higher valuation bring to the neighborhood a higher grade of people, create better social conditions, and the farmers' young people find greater social advantages and contentment. So, considering the advantages and disadvantages, let us, for the time being at least, prepare to welcome the Easterner and show him the garden spot of the earth. California offers every inducement; let California men and women accept them. Speaking of the women, by the way, reminds us that some of the best civic improvement societies in this state are made up of women who realize the real value of beautiful surroundings.

One county has already officially taken the first step. This is Los Angeles, which has appointed a commission to have charge of roadsides and parkings of the county. It is expected this will lead to the selection of a forester or tree warden who shall have charge of roadside plantings of the entire county outside the municipalities. Los Angeles may usually be depended upon to keep step with any advance movement; let every other county in the state excel her if possible.

It is to be hoped that the Arboricultural Conference held in Los Angeles recently will inspire action on the part of people in various parts of the state. This conference was fathered by three different organizations, the Southern California Arboricultural Society, the State Planning Commission, and the Civic Federation. Dana Bartlett, of Los Angeles, presided, and the discussions and addresses were most valuable. One of the addresses given appears on the first page of this week's Cultivator and is by that veteran tree warden, J. H. Reed, of Riverside. Others will appear later.

PACIFIC COAST NURSERYMENS ASSOCIATION.

A letter from George C. Roeding, President of the Pacific Coast Nurserymens Association, calls attention to the importance of this meeting, which is to be held in San Jose, Wednesday, Thursday and Friday, June 21-23. The three days will be given over to discussing the needs of the nursery trade and methods of handling fruit conditions of the Pacific Coast. Several states join in this association, and remarkably able delegates will be in attendance. The state should unite in giving a royal welcome, and San Jose is reported to be in line for doing its share. Among pleasant features we note that the Chamber of Commerce of that city will take the delegates in hand on Thursday for a trip through Congress Springs, Los Gatos, Saratoga, Campbell and other fruit growing districts of the Santa Clara Valley. Friday afternoon Manager Eberly of the California Nursery Company will take the delegates in a special train for an inspection of that nursery. The Cultivator hopes to have an outline of the program in hand for the next issue.

The last decade has shown one peculiarity in the farms of Arizona; their number and value have materially incerased, but the farm area of the territory is less today than it was ten years ago, the decrease amounting to 700,000 acres. This decrease is more apparent than real, however, for the reason that so-called agricultural lands of the railroads have been transferred to the forest reserves. In valuation per acre Arizona's increase is 475 per cent, while the increase in value of farm lands, including buildings, is 436 per cent. The total expenditure for farm labor now averages 117 per cent higher than ten years ago, and increase in total expenditures for farm fertilizers is 100 per cent. The average acreage per farm has decreased during the decade 54 per cent. All told, there are in the territory 8,078 farms.

The Florida Grower says:

"One hundred dollars spent yearly in a national campaign of advertising for Florida citrus fruits would add certainly from 25 to 50 cents a box to the price received on the trees, and this campaign would cost only two cents a box to carry on."

We believe the Grower is right in its general statement as to the value of advertising, but we believe this suggested appropriation is decidedly low. One hundred dollars these days spread over the East would cover the country so exceedingly thin that we do not believe any very substantial results would be observable. Perhaps about three ciphers were left off the suggested appropriation.

It is with a great deal of pleasure that the Cultivator reports Mrs. M. E. Sherman recovering after a serious operation performed in one of San Francisco's hosiptals. Her recovery is so far advanced that we have received a short note in her own hand. We congratulate our readers that while it may be some time before she is able to contribute to the live stock department, she promises that as soon as possible she will be again with us.

With citrus fruit shipments more than 10,000 cars in excess of last year this same date, and all handled so as to bring an average of the best prices ever received, the citrus grower is appreciating more than ever the value of his co-operative system, which markets the greater part of this crop. California may well feel proud of its greatest co-operative marketing organization in the world.

The state engineer has issued his biennial report covering two years preceding November 30, 1910. Of course it gives many points regarding construction of state buildings, and in addition many facts regarding reclamation of lands along the Sacramento and San Joaquin Rivers, and also gives information on state highway construction.

We note that Superintendent Carnes of the State Insectary is carefully nursing a bug to eat more bugs. It is in the form of a parasite of the black scale. This beneficial insect was sent to the state insectary from Cape Town, South Africa; its name is Aphicus Lundsbury.

Agricultural News Notes of the Pacific Coast

Northern California

Some Sonoma County hop growers report offers of 22 cents.

Honey Lake Valley, Lassen County, is experimenting in sugar beet culture.

Corning Poultry Association is planning for its next show to be held in November.

A delegation of Santa Cruz County poultrymen visited Petaluma poultry yards last week.

One apricot grower at Hayward, Alameda County, reports the sale of his cots at $60.

With only 103,000 tons of holdover hay it is predicted that prices will be exceptionally strong.

Sites for two high dams and reservoirs have been filed on in Tuolumne County for power purposes.

A rancher in Alexander Valley, Sonoma County, has sold his crop of dried prunes at $130 per ton.

A half million dollar corporation will reclaim and irrigate 2000 acres of tule lands in Siskiyou County.

The cold weather prevailing through most of the spring has proved a serious setback to many hop yards.

The Empire Lumber Company, of Mendocino County, has sold 24,000 acres of timber land for $500,000.

Sacramento hopes to secure a branch of the state highway on top of the levees of the Sacramento River.

Alameda County is planning for a fine building to exhibit its products in at the Panama-Pacific Exposition.

Colonists are settling in the neighborhood of Arbuckle, Colusa County, for the purpose of growing almonds.

Happy Valley, in Shasta County, reports century trees in bloom, the first within the memory of the oldest inhabitant.

An irrigating pump with capacity of 185,000 gallons per hour has been installed at Maine Prairie near Dixon, Solano County.

Orland's Carnival at the formal dedication of the reclamation dam is promised to be a hummer with various games, contests and parades.

The Horst Company, of Wheatland, is preparing hop picking machines for the coming season; these machines have been tested for several years.

The Butte County board of supervisors is being petitioned to levy a tax to provide a suitable county building at the San Francisco World's Fair.

Redding, Shasta County, had a visitation of grasshoppers which were so numerous that they were gathered in great piles underneath the arc lights.

Several crates of apricots are going forward from Sacramento every day and car shipments will soon be in order. Prices are the best ever received.

Commissioner Hecke of Yolo County reports the flea beetle doing much damage to the large vineyards near Woodland; hundreds of four-year old vines have been killed.

The weather observer at Sacramento estimates almost a record height for the Sacramento River during the month of June because of the snowfall reports received from various mountain stations. There are still some sections showing fifteen feet of snow.

Central California

Madera reports extensive planting of figs.

Tulare shipped two cars of orange honey last week.

The first car of cherries out of San Jose this year was on Saturday, May 27th.

Kings County peach growers are finding it necessary to thin their Muirs.

Hanford peach growers are being offered $30 per green ton for good canners.

Lindsay, Tulare County, expects to have a rural delivery route from its postoffice.

Kings County celebrated its birthday at a "Kings Kounty Karnival" at Hanford last week.

Santa Clara Valley will ship about 100 cars of cherries this season as against 155 last year.

A large ranch near Tulare has been subdivided into smaller dairy farms, over 3000 acres being subdivided.

The board of trade of Turlock is urging the shipment of fruit and other products by barge instead of by rail.

A section of 8000 acres of land near Fresno has been purchased and an immense colonization scheme is proposed.

Orange pickers at Lindsay went on a strike last week demanding five cents per box instead of four, the former price.

Prunedale, Monterey County, reports all crops looking the best; beans show a largely increased acreage over former years.

Packing houses at Turlock have been enlarged and new machinery and appliances installed to handle the increased output.

Onion growers near Stockton have received notice from the shippers that they will not in the future handle onions offered in old bags.

Orange orchards in eastern Fresno County are carrying the biggest crop of fruit ever; the output of the county will be double that of last year.

Growers of red onions near Lodi, San Joaquin County, have been producing between 200 and 300 sacks per acre and selling at $2.00 per sack.

A writer in the Fresno Republican advises every fruit grower this year to hold for the top of the market, as this is what he terms the fat year.

A mass meeting was held at San Jose last week, the aim being to encourage the more extensive employment of white families in fruit harvesting.

The thrips destroying device invented by a Dinuba vineyardist is working overtime and it is estimated that the machine is catching 30,000,000 bugs an hour.

Patrons of the Spreckels Sugar Factory at Spreckels, Monterey County, will hold a picnic tomorrow. An address will be made by Prof. Shaw of the State University.

Deputy Commissioner Riley of Tulare County reports plant lice as exceptionally thick; they are affecting the young growth of orange, peach and plum trees, as well as melons and other garden truck.

Southern California

Manifee, Riverside County, reports honey crop almost a failure.

Grape shipments will begin in a short time from the Imperial Valley.

Santa Paula lemon packing houses are working full gangs of men overtime.

The Antelope Valley claims to be an ideal almond producing section of the state.

Coachella Valley in Riverside County is shipping quantities of tomatoes at $3.50 per crate.

Southern California estimates that its hay crop will be about 75 per cent of that of last year.

Ventura Chamber of Commerce has already begun to plan for its exhibit at the coming state fair.

The Redlands Golden Orange Association is experting its books and calling for an accounting from its former manager.

The brick work on the Holly Sugar Factory near Huntington Park is complete and the machinery practically all in place.

A mathematical orange grower has figured out that nearly 2,000,000,000 oranges have already been shipped from Southern California.

A Japanese colony at Mesquite Lake, Imperial County, has 200 acres in onions; they are shipped green in crates to the Los Angeles markets.

A conference of foresters and tree wardens was held in Los Angeles last week and methods of beautifying the roadsides of the state were discussed.

San Diego claims that the cost of her Carnival and pageantry at the breaking ground ceremonies for the Panama-California Exposition will be in excess of $50,000.

Hueneme fishermen report a great run of smelts; the only limit to the catch seems to be the number of hooks on the line; eight hook lines were repeatedly hauled in with eight smelts.

Cucamonga, San Bernardino County, orange growers have formed a Growers Fumigation and Supply Company which will purchase supplies and have charge of fumigating orchards of the members.

Monrovia, Los Angeles County, is making an exhibit of introduced tropical fruits which shows a wide range of cultural conditions. Much of the fruit was introduced from the Hawaiian Islands.

The general land office at Washington has announced its decision in the Palo Verde case in which 100,000 acres claimed as swamp lands near the Colorado River are declared to be open to homestead entry.

The government station at Bard near the Colorado River, Imperial County, has produced five bales of Egyptian cotton which were sold to the Clark Thread Company at 28 cents per pound. The yield was about one bale per acre.

Antelope Valley orchardists are greatly disappointed in the failure of Governor Johnson to sign the fence law passed by the last legislature, but it is now found that reasonable damages may be collected for injury by trespassing stock.

The Coast

Spokane, Washington, hopes for the early establishment of a union stock yard.

Centerville, Washington, has good crop of apricots already as large as walnuts.

The Farmers Union of Lincoln County, Washington, are against reciprocity with Canada.

Wool so far received at Caldwell, Idaho, has been warehoused awaiting more satisfactory prices.

Grain growers at Pullman, Washington, report the whole Palouse country will have a bumper crop of grain.

Railways of Washington and Oregon are planning for increased freight equipment to handle the season's output.

The Union Stock Yards at Portland, Oregon, reported a drop of 60 cents a hundred in price of prime steers last week.

Wheat growers at Odessa, Washington, have gangs of men going through the wheat fields and cutting out noxious weeds.

Grain fields along the Canadian Pacific were given a heavy rainstorm last week to the great improvement of crop prospects.

Cattle men at Boise, Idaho, are forming a cow testing association. The idea is to have a fine article of food for humans.

A form of gummosis has attacked cherry trees near Spokane, Washington, and experts are baffled to know about its control.

At a wool sale at Pilot Rock, Oregon, on May 26th, 20 clips were offered and sold at prices ranging from 12⅜ to 14⅝ cents.

At a recent sale of Indian lands near Vollmer, Idaho, some of the most valuable portions were sold at more than $100 per acre.

The Douglas County, Washington, Farmers Union has appealed to the state railway commission to investigate rates from Mansfield.

Wenatchee, Washington, estimates that the recent rain will assure the biggest wheat crop in the history of the central part of the state.

Boulder, Montana, reports the spring decidedly backward with scarcely a rain, but present conditions good for a crop of grain.

Experimental pig feeding at the Pullman, Washington, Experiment Station, has shown that "tankage" is a very valuable addition to the feeding ration.

Portland reports wool two to three cents lower than last year. Last week over a million pounds were disposed of at prices ranging from eight to fifteen cents.

Two wool clips from Boise, Idaho, aggregating a half million pounds have been sold to a Boston wool house, the total purchasing price running well up towards $75,000.

Fruit growers associations of Hood River, Wenatchee and Milton, Oregon, are protesting at the ruling of the railways that the minimum carload shall be 24,000 pounds. The fruit men's contention is that they will be driven from the smaller markets by the new ruling.

BUY BABY CHICKS NOW--Special Prices.

We have 5000 per day of most all standard varieties of chicks. Right now we are making special prices on chicks in lots of 100 or more. Send today and state what kind of chicks you wish, and we will be glad to quote the price. We sell hatching eggs of all standard kinds, also cocks, cockerels, and laying hens and pullets.

Write us your wants today. Largest Baby Chick Dealers in the world. We handled 23,000 baby chicks in one day. That's the largest hatch ever made in one day in California. Get the free 64-page catalog; send today. The world's largest chick dealers.

PIONEER HATCHERY

108-118 East Eighth Street, Los Angeles, Cal.

Dwarf Milo Maize and Red Kaffir Corn

The two great drought resisters should now be sown. There is no more profitable dry land crop than these two members of the sorghum family. We have taken particular care in selecting acclimated seed stock of the true dwarf varieties, yielding two to three tons per acre. Write for samples and cultural directions.

Pacific Egg Food

Makes hens lay; none better. Special prices: 90 lb. sack, $1.75; 75 lb. sack, $1.50; ton, $37.50

Seed catalog "G;" Poultry supplies "H;" Which shall we send you?

Monrovia, Cal.

Wanted—If the thousands of people in Los

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will convey a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

"THE SORROWS OF OTHERS."

By Mrs. A. Basley.

There are so many pleasant things in the chicken business that I reluctantly turn to the sad side, but just now there are some shadows from the troubles of others that we must try to break through, especially as it may help others besides my sorrowful correspondents.

S. C. F. writes: "I have a hen with twelve little Wyandottes that are getting sick. I killed two of them that were sick. They had phlegm in the throat and were sore in the corners of the mouth, and I fear that more are getting the same way. My other three broods are doing fine, but they were hatched in February and March. These twelve were two days late in hatching but thirteen hatched out of fourteen eggs."

This is a request from a successful and careful breeder, but I feel sure that the chickens have now lice and possibly mites. I think that the reason two hens were late in hatching was that they had mites and possibly lice also. It is very easy in this climate to let the mites get in. One man told me he saw three mites one day and did not think much of it, so he waited three days before fighting them, and he said in those three days there had been hatched out three million. When the setting hens have mites it so lowers their vitality that they either die on the nest or if they manage to live the low vitality is communicated to the eggs and the chicks in the eggs, and this makes them late in hatching, and usually gives the chicks a weakened constitution, which succumbs to the first baby illness or chill.

Now the first thing to do is to get rid of the lice with the little chicks and in this instance, as the writer of the letter is a busy man, I would say get some buhach or California insect powder and powder them thoroughly. Try it at night. Take them into the house. Put a newspaper on the table, rub the powder well into them and then see the lice fall out. Then put the hen and the chicks out in a clean coop on the lawn away from any of the other chickens and give the little chicks some Germozone in the drinking water. This should be renewed at least three times a day. Swab out their throats with Germozone, give them planty of onions chopped fine and mixed with bran or with hard boiled eggs and bread crumbs and give them all the lettuce they will eat. The onions will cure the cold and be a good tonic for the liver and kidneys.

I am afraid that it may be roup, and that the chicks having a weakened constitution from the slow hatch may have it so severely that they will not recover. Be sure to bury the dead very deeply or better stil burn them. You do not want to leave anything about that can possibly infect the others later on.

Mrs. W. T. K. writes: "My hens have a very strange ailment. They seem to lose the use of their legs. They are not apparently sick, combs are red and they eat well. The first one just sat down all the time. We thought it possibly might be worms so we gave her worm medicine, and when we finally killed her we cut her open and could not find a thing wrong with her. She was very fat. That was a white Orpington that I paid ten dollars for. Now we have a Buff Orpington that is beginning in the same way, she eats well and does not seem sick, but cannot use her feet. Can you suggest any solution of the problem and give any remedy? Do you suppose that lack of sharp grit would cause it?"

These hens as the post mortem showed are too fat. This is caused by two things, first not enough exercise and second wrong feeding. The dual purpose fowls such as the Orpingtons and Plymouth Rocks very easily get overfat at this season of the year if they have not plenty of green food (at least a third of the food should be green), and they should exercise for all the grain they get. The overfeeding of heat-giving foods in this climate to those breeds, the lack of exercise due to close houses and small yards and insufficient scratching material, all these cause a deposit of fat in various parts of the hen's body and eventually affect the liver, causing weakness in the legs and hypertrophy of the liver. I would advise you to give the whole flock a little epsom salts in the drinking water (a teaspoonful to each quart of water) for a week and the following week give the same amount of bicarbonate of soda, reduce the amount of fat-forming food and give more green food; also give onions chopped finely. To the Buff Orpington that is now ill give for a week every day ten grains of sulphate of magnesia and bicarbonate of soda.

You little know what injury you do to your flock by not making them exercise by scratching for all their grain in deep straw or hay. You not only make them too fat and prevent their laying, but also you weaken the constitution of the offspring. It is not a "strange ailment," but a too fattening diet that is killing them. We who have been in this climate for years learn to know that plenty of green food at this season, plenty of fresh water and plenty of exercise are necessary to keep the fowls vigorous.

Mr. W. G. brought for examination four little dead turkeys from two to six weeks old. There was not the slightest symptom of disease on the exterior, they were beautiful birds, plump, large for their age and well feathered. No signs of cold or roup. We opened all of them and my verdict was either ptomaine or fungoid poison. There were signs of congestion all the way through. Little bright red veins showed clearly the whole length of the bowels. The caecum was in good order, the liver rather small and dark from congestion, above the heart or almost round it was blood and the kidneys and lungs were also slightly congested. Death came from the congestion of the heart for evidently a blood vessel there had burst. We talked over the problem of how they could have been poisoned, finally deciding that it must have been either from the granulated milk, or the new bran, and Mr. G. went home determined to send some of both to have them analysed at the Agricultural Experiment Station at Berkeley.

The chief source of ptomaine poison is bad animal food. We cannot be too careful about this. In the summer time, or in fact at any time in this climate meat goes bad very quickly. A lady I knew gave her hens some green bone, it was sold her from a meat wagon and she thought that as the man said "it was good enough for chickens" even if it smelt a little "high," she would feed it. The next morning she lost about a dozen of her best hens. A man found a nice fat hen dead under the perch. He threw it up on the edge of the roof intending to bury it that evening, but forgot it. In a few days he found half a dozen of the hens in the pen dead and two very ill. He guessed in a minute it was the maggots from the dead hen and buried her. Maggots from a decaying dead animal, gopher, squirrel, rat, cat, dog or even bad meat, will kill both chickens and turkeys and even ducks. Another man lost over $3000 worth of chickens from bad beef scraps. I rather think those beef scraps were perfectly good when he bought them, but that the rats got in and moistened them and in a very few days ptomaine poison had generated and the good food was turned into a subtle poison.

Dr. Sanborn says: Extreme care must be employed in selecting the meat food or beef scrap as it is through infected beef scrap that many cases of bowel trouble arise. Good

beef scrap should not have a foul odor, neither should it be lumpy or full of vegetable fiber (adulteration with cotton-seed hulls). If the scrap is lumpy and the lumps show white in the interior on being broken apart the scrap should not be fed to either young or old; it is only fit for fertilizer.

A good way to test beef scrap is to examine it first for lumps. If none are found and the scrap smells reasonably sweet wet up a little of it with scalding water. If the odor remains sweet and meaty it is usually safe to feed the scrap. Good pure meat scrap may be fed freely with no danger of harmful results if the chickens have plenty of raw vegetable food.

A friend of mine poisoned ducks by giving them buttermilk that had spoiled, become putrid. Drinking vessels that have contained milk should be frequently scalded, and rinsed with sal soda.

THE BREEDING OF DUCKS.

Ducks are becoming very popular, and many new breeders will venture into the line of poultry keeping. Already many letters have reached us asking us how much and how often to feed ducklings. Well, I am convinced that five times a day is not too often to feed ducklings for the first ten days. Not a great amount, but just what they will eat up quickly. After our ducks are ten days old we feed but three times daily. Don't overlook the old ducks, but see that they get their food twice daily—morning and night. I am convinced many amateur breeders feed ducks too much. It's not so easily done as with chickens, but it is frequently done. Never, under any circumstances, do we feed more than they will clean up quickly. Ducks are surprisingly free from disease, but if overfed leg weakness is the result. We feed in troughs made for the purpose and as soon as our ducks walk away from the feed we remove what is left in the troughs and feed to hogs, or if it has not been soiled we retain and feed it for the next meal. Ducks are easily killed by feeding on sour foods. Hence the cleaner you are about your duck yards the better success you will have. The old ducks should never be neglected as soon as you produce a new output of ducklings. Very frequently the old ducks are neglected as soon as ducklings are out to attract attention. This is a serious mistake and should never be tolerated. We feed our old ducks with as much care and attention after the ducklings make their appearance as before and find they respond very readily to good treatment and feed the year round. It is very true you can get ducks, especially the breeders, too fat if fed largely on corn or cornmeal. Prepared fish foods offered on the markets are excellent for the breeding ducks, but unfit for the ducklings if intended for market purposes, as it will taint the flavor of the flesh. Wheat bran, cornmeal, whole wheat and beef scraps make the finest food for the breeding ducks. This ration is fine for the ducklings, also should you not care to offer your ducklings on the early markets for broiler purposes the commercial fish foods are fine for young ducks; it serves the purpose of natural food ducks receive along brooks and ponds. Strange as it may appear, yet it is true, milk is not good for young ducklings, for the reason it will get in their eyes, causing sore eyes and disfiguration. I much prefer milk to water for mixing the mash for ducks, but to give it the same as we would to any other fowl proves fatal.

About the only trouble you will have with ducklings will be leg weakness. As soon as you discover your ducklings are suffering from this trouble feed less cornmeal and more whole grain. I know some writers claim whole grain will kill ducks. I once thought the same thing, just because I heard someone say so, but it proves to be a false impression. However strong your impressions may be that whole grain will kill ducklings, dismiss such an idea from your mind and feed mixed grains freely, especially if leg weakness makes its appearance. If sand and sharp grit is given freely the ducklings will develop much quicker than they would otherwise. This must be provided freely to the ducks that are brooded indoors. It must be remembered that ducks soon render their quarters filthy and litter must be provided frequently, removing the old litter at least twice a week. If you are compelled to handle your ducklings, always handle them by the neck, as their legs are very tender and with but a slight flounce the duck will surely cripple itself, rendering it worthless for any purpose. Hence, to avoid any disaster of this kind, I prefer handling them by the neck. Ducks are not only tender, but very timid. If you approach them at night with a lantern you do them more harm in one minute than you can regain in one week's care and feeding. Strange as it may appear, nevertheless it is true, a lantern will cause a falling off in eggs faster than you can feed them up to save your life. Some duck fanciers would no more approach the ducks at night with a light than they would write you a check for several dollars. They consider the loss just the same as you would so many dollars. I don't know of anything that is as fatal to egg production in ducks as to frighten them a few times at night with a light. At any event, avoid a fright in your breeding yards, and likewise use the same precaution with your youngsters, but the most fatal results are with the laying ducks. Speak to your ducks when you approach them the same as you would to your horse and they will soon become attached to you.—American Poultry Journal.

A DOSE OF EPSOM SALTS.

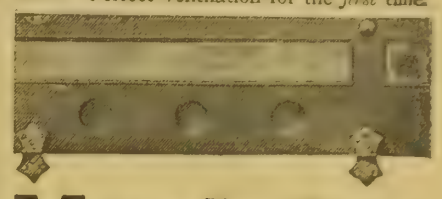
A good dose for one fowl is a teaspoonful of the salts. For 140 hens, make a mash of ground grains and bran, and wet with water in which the salts has been dissolved. While one teaspoonful is a good dose for a sick hen, it would not be wise to give 140 spoonfuls in a mash for 140 hens, as some hens would get more than their share. A quarter to half a spoonful for each hen in mash would ordinarily be sufficient. Or the salts may be given in the drinking water.—Wallace's.

WEAK DIGESTION.

For mild attacks of indigestion caused by heavy feeding, when the quality of the food given is not wrong, there is nothing so good as fasting or withdrawing the greater part of the food from the fowls, excepting the green food for a day or two and then feed sparingly. In hens forced for eggs the digestive system is often overworked. It may affect only a few hens of the flock as a system of feeding or a quality of food that one hen or one pen stands all right may be all wrong for another of the same flock. A poultryman must judge of how and what to feed by watching the results in his own flock. To get good growth and heavy egg production, we must feed heavily on rich foods. And we are running the risk of breaking down the digestive system by overwork. Watch closely the signs of indigestion especially lack of appetite and looseness of the bowels. When such symptoms attack a few hens of the flock remove them to quarters by themselves for a few days and let them go without grain for a day or two, as the case may seem to require. A little attention paid to such individuals of the flock will keep up a strong, vigorous strain. A hen predisposed to looseness of the bowels will not be a good breeder. We want hens that have bright, red combs and wattles and are the picture of health to put in the breeding pens. The pale-combed individuals have no place in a good breeding pen. Weak digestion can be transmitted from one generation of fowls to another until the flock is all run down and it becomes necessary to start with new blood.—Wisconsin Agriculturist.

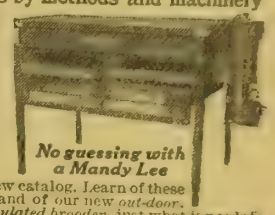
SULLIVAN'S
Buff Orpingtons
1000 birds to select from. Trios, $7.50 and up. Eggs for hatching, $2 and $3. Special selection; prices on application. Mr. & Mrs. W. S. Sullivan, 50 Market St., Agnew, Santa Clara Co., Cal.

More Inventions by Lee
Here's his new Incubator door all are talking about. Perfect ventilation for the *first* time.



Mandy Lee Incubators
supply life-giving oxygen freely to the eggs and just as naturally draw off the poisonous gases. The most important step ever taken in incubator ventilation—neither above nor below, but *right at the eggs*—the correct principle, for the new Mandy Lee is making better hatches of *stronger* chicks than any other incubator in the world.

We Measure Everything
Heat—moisture—ventilation. You *guess* at nothing. If the eggs are good and you follow simple directions your work with a Mandy Lee is as nearly an absolute certainty as anything can be. There is no more reason why you should buy an incubator that regulates nothing but heat than for a farmer to continue to harvest his crops by methods and machinery used 100 years ago. Your success with poultry depends on your ability to select equipment that is *right*—that's what you *always* get from us.



No guessing with a Mandy Lee

Send *to-day* for new catalog. Learn of these new improvements and of our new *out-door, lamp-heated* and *regulated brooder*, just what is needed.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Geraniums Blasting.

What is the cause of geranium buds and flowers drying up as soon as they open? The bushes look thrifty, but as soon as buds open they die.—Subscriber, San Diego.

This is doubtless due to the variety of geranium. The inquirer does not say, but we presume it is the double geranium. For this reason the singles prove far more satisfactory. In selecting plants for taking the next slips from or in purchasing young plants, be sure and observe this habit; some of the doubles are not so badly affected as others, but even these may blast if care is not taken in watering with hose and allowing water to spray over the blossoms. When the sun shines on them afterwards they are almost certain to blight.

Bee Paralysis.

My experience in treating bee paralysis has been successful. We hunt out the queen and kill her, and wait about two days and then give them a queen cell from a good, healthy stand. Do not let the bees raise any queen from their own brood, and I will almost guarantee them to come out all right, as ours have that we have treated that way.—Mrs. B. L. D., Fillmore.

Angora Goats.

Can you give me any information in regard to the raising of Angora goats? In what part of this country are they raised with the most profit, etc.? How are the mountain lands of Southern California for goat raising? —Subscriber, Tropico.

There is no reason why Angora goats should not do well in Southern California if one has range which will provide abundance of feed. From San Jose north, however, we think their raising would be attended with greater profit because of the more abundant rainfall giving better pasturage. Probably the greatest Angora goat raising section is in the Northwest, particularly in Western Oregon and Washington.

Container for Egg Preservative.

Can I use galvanized iron tubs for preserving eggs in water glass? If not, what is the best vessel to use? Would like to hear from others as to what they have used.—C. A. Loud, Standard Poultry Yards.

We would not use any metal container. The liquid will remain in them for several months, and while the water glass may not have any particular affinity for galvanized iron, we would prefer either earthen jars or wooden tubs or tanks. These are both entirely satisfactory, but care must be taken to keep surface covered so that liquid will not evaporate.

Palm Seeds.

How shall I treat palm seeds to make them germinate? They have been in the ground three months and have not sprouted.—A. E. R., Laton.

We do not know whether this seed will stand boiling water or not, but some seed requires treatment with boiling water. They should be covered and allowed to stand over night, and be planted in the morning. We also know of palm seeds that have been planted and remained in the ground several months before sprouting, and ultimately made fine, thrifty growth.

Sulphuring Roses.

How may sulphur be applied to roses affected with mildew, dry or in the form of a spray?—Subscriber, San Diego.

Sulphur may be applied with a little hand bellows or simply scattered by hand over the leaves when they are moist with dew. If in the open sunlight where the sulphur is later vaporized, good work will be accomplished. In the shade the effect is not so good. In this case a form of liquid spray known as sulphide of potassium given in our issue of November 3rd, composed of potassium sulphide six ounces, water 100 gallons, is better to use and it does not color nor injure foliage.

Nitrate of Soda—Alkali.

I have noticed much discussion regarding nitrate of soda producing black alkali, and would like to ask if you consider 150 to 200 pounds of nitrate of soda applied in November in prune orchard, for benefit of cover crop as well as the trees, a good thing, or is the black alkali question sufficiently dangerous to warrant leaving the nitrate alone?—Subscriber, Campbell.

There is carried into the ground by the application of nitrate of soda some carbonate, which is the ordinary black alkali. In theory this would in time increase the percentage of alkali in some heavy soils so that there might be danger, but in practice we have never heard of any injury, and one case has been reported of the application of thirty-five pounds of nitrate of soda to a single tree, which resulted, so far as could be observed, only in benefit. However, we would under no circumstances apply in the fall as suggested by the inquirer, because the very purpose of green manuring, over and above the formation of humus, is the securing of nitrogen from the atmosphere. If the nitrogen is supplied in the expensive form of nitrate of soda, the bacterial action is not so active, and part of the profit of the green manuring crop is lost. As to benefiting prune trees by a November application, we do not think that would help in any way. The nitrogen in nitrate of soda is very elusive, and one season's heavy rains would carry it all away from the roots before they become active in the springtime. The application of nitrate of soda or any other quick acting form of nitrogen should be in the spring, when the roots are ready for taking it at once. Our suggestion would be to apply bone meal or superphosphate on the cover crop, and let it rustle for its own nitrogen and potash.

Sex of Chicks.

Some breeders claim to be able to distinguish sex of chickens when first taken from the incubator. No doubt this ability is dependent on close observation? A general outline of the method of judging would be appreciated.—J. W. S., Hayward.

We do not believe the claim of these poultry breeders can be made good, but if there are any who make the claim who see these words, we will appreciate it very much if they will give the Cultivator readers the secret. We imagine, however, it would be very similar to the claim made for years of the ability to determine sex of the chick from the egg. Every theory ever advanced along that line has been proven without foundation. We doubt not it would be most valuable to poultry breeders to pick with reasonable certainty the pullets from day-old chicks.

Soil for Tomatoes.

I wish to plant tomatoes on heavy, sandy loam where I have grown them for three or four years. Wish to use fertilizer for forcing and increasing crop. Is nitrate of soda desirable and how much per acre? Will plant rows seven feet apart. Should fertilizers be applied between rows and would the effect be less upon a crop bearing another year?—G. M. L.

Planting tomatoes on land that has grown tomatoes three or four years is such bad farming that my counsel would be do not attempt it. It is almost certain that it will prove unsatisfactory, no matter how much you fertilize. If however, you feel like risking it, it would be better to use some good brand of superphosphate at the rate of six to seven hundred pounds per acre, sowing it broadcast and harrowing it in before planting. Then about the time the plants begin to bloom sow broadcast 200 pounds per acre of nitrate of soda and 15 days later a like amount of nitrate of soda. Break up all lumps in the nitrate of soda with the back of the spade and it would pay to run it through a coarse sand or gravel screen, say one-fourth-inch mesh. This will enable you to sow it regularly. Cultivate after each sowing. It took me a good while to learn that there is nothing gained in setting out tomato plants early in Southern California. It is better to wait until the ground gets well warmed up. But you must keep your soil in first-class condition by frequent cultivation, very much as the lima bean growers do, so that when you are ready to set your plants the soil is moist enough to allow the plants to start without resort to water. My own practice is to grow the plants in pots, or next best, in flats so that they can be transplanted without check.—Q. A. L.

Ripening of Lemons.

I have a few Eureka lemon trees bearing fine fruit, which does not ripen in hot weather. Cannot I get a variety that will?—Subscriber, Winchester.

Our subscriber is confronted with a difficulty not often before lemon growers. Most complain that their lemons turn yellow before they attain proper shipping size, but if the inquirer will pick his lemons as soon as they become of proper size, store away in boxes where they are not allowed too much air to make them wither, he will find in the course of a few weeks that they will take on a beautiful lemon color. Lemons which ripen on the trees are almost sure to be filled with seed, while lemons picked while of a perfectly green color will be seedless, juicy and in fact almost perfect in quality. If ripened on the trees and taken to market they will necessarily command lower price than when picked green and cured in the house. If only a box or two of lemons are in hand, the wrapping of each individual lemon in paper is sometimes thought best. This prevents excessive evaporation and also at time of sweating absorbs the surplus moisture, so that there is less danger of decay.

Moles.

I am a newcomer and my troubles are legion. My recently purchased ranch is over-run, or rather under-run, with moles. How may I get rid of them? They have completely ruined a new lawn, and traps which I have used have captured but few of them. —Newcomer, Whittier.

We are glad to receive Newcomer and appreciate that he comes to the Cultivator for help. If his troubles are no greater than those caused by a few moles, he is indeed fortunate, though even such troubles if they be legion, sometimes cause life to be a burden. Moles are very easily controlled, at least the writer has so found them. In fact, we never catch one of these little fellows without a twist of conscience. As a matter of fact they would be beneficial if only they would cease the upheaving the ground in the new made lawn. They are consumers of grubs and other pests of the soil; they do not destroy roots of plants and only take away the enemies of those roots, but it must be confessed that their run-ways do disfigure flower-beds and especially lawn surface. When it becomes necessary to remove them, the use of the ordinary mole-trap does it very easily. The trap which we have used is the "Out-of-Sight," and is set by finding the main run-way of the mole, pressing down a three or four-inch stretch of the run so that when the mole comes through again he has to raise this section. The trap is then set so that the trigger rests immediately above the pressed down surface, with the two jaws of the trap on either side so as to catch the mole coming from either direction. We have never heard of any way of poisoning because the trapping has been sufficient.

Gum Disease.

What is the trouble with my lemon tree? It is five years old, filled with fruit, but black ants are swarming over it and they have killed the bark around the foot of the tree. What will prevent this? The tree is covered with black scale.—Subscriber, Anaheim.

We think our subscriber is mistaken as to the ants destroying the bark at the base of the tree. We think they are simply swarming over the tree to secure the honey-dew exuded from the bodies of the black scale. The destruction of the bark is doubtless due to gum disease, which is caused by the condition of the soil. If the tree is fumigated to destroy the black scale and the soil is loosened up about the roots and put in the best of condition, and the parts of the trunk affected by the gum disease are scraped and an application of neat's foot oil made, we believe the troubles of this tree will disappear. For more complete treatment we would refer you to the Cultivator of April 13th, page 451, by Mr. A. F. Call, which is generally considered to be the best ever suggested.

Erinose.

I send walnut leaves with blisters or foreign growth on them. What is it and what shall I do with them?—I. L., La Grange.

This was referred to Prof. Smith, and he answers:

"Your correspondent's walnut leaves are affected with the so-called erinose or blister mite. This is a very small insect which gathers in numbers at certain spots on the under side of the leaves and produces there these little blister-like swellings. The trouble is not a serious one, although very common, and there is no necessity of carrying out any treatment to suppress this insect.

Blossoms Dropping From Tomatoes.

What is the cause of and what will cure defect in tomatoes, dropping off of young fruit or blossoms? The vines are healthy looking. Will alkali soil cause it? They break off about an inch back from the blossoms. It is the Ponderosa variety. Another variety, the Tennyson, growing alongside, is not as vigorous,, in fact is wilting and half dead, yet does not lose its blossoms. — Subscriber, Santa Barbara.

The vigorous vines are no doubt losing their fruit because of the cold weather, which will cause exactly the condition you mention. The others which are wilting may be affected

with blight. If this is the case, they should be removed and burned at once, and another year clean ground be secured for the tomato planting. We do not think there is any cure for the dropping of the young fruit excepting warm weather, and for early fruit the selecting of other varieties. We do not think alkali is a factor in the case.

Plowing at Blossoming Time.

How about plowing during blossoming time? Will it lessen the setting of fruit? My trees are prunes, and I would like to know if there are not small roots near the surface that would be cut in plowing so as to injure the tree and the fruiting, if done just prior to or during blooming? Also in use of dynamite to uproot dead trees and to loosen sub-soil for a new tree will there be any injury to another tree twenty-five feet away?—Subscriber, Campbell.

Without doubt plowing at blossoming time cuts many rootlets which come to the rich surface soil for nourishment, and we believe that plowing prior to blossoming time, two or three weeks or a month, if possible, is to be preferred, but we would by all means give the deep plowing, and if the work has been deferred to blooming time we would take the chances rather than attempt to carry the orchard through the summer season without the benefit of the deep plowing. The injury depends somewhat upon the past working plan in the orchard. The orchard which has been plowed thoroughly since setting will have no large roots near the surface to injure.

There could hardly be any injury to a tree twenty-five feet away from any reasonable charge of dynamite. Many orchardists in hardpan sections place charges of dynamite much nearer trees than that purely for the sake of loosening up the subsoil, and with benefit.

Sulphur-Lime on Twigs.

I sprayed my peach trees with standard lime-sulphur solution, and some buds were burned and some young twigs. What was the trouble?—J. O., Glenn.

The sulphur-lime solution was used too strong and destroyed the growth. Spraying two weeks earlier would have done fully as much good to the tree and would have saved this young growth. This wash is too caustic to apply in usual strength after growth has started.

Time for Budding.

I have 600 two-year-old orange trees I would like to have budded. When is the proper time, and where can I get a budder?—Subscriber, Hollywood.

The proper time for budding is early spring, when the sap first shows good strong flow and the bark will peel; also again in the fall. The present time is a little late, though if in best growing condition it is possible you could get buds to grow. Buds can be secured from any orange or lemon grove, but of course it is best to get them from trees which are known to bear high-grade fruit. As to the budder, we know of no one in your neighborhood, but a little inquiry will probably develop one. Any nurseryman should be able to inform you.

Dying Watermelons.

I send with this watermelon vines which are mysteriously dying. The vines are healthy until the trouble shows; it appears to be at the root. Is it insect or other trouble, and what is the remedy? Neighbors' vines are also affected. There are ants in other portions of the field, but not in the part affected.—Subscriber, Spring Valley.

Mr. C. O. Smith, Assistant Plant Pathologist at the Southern California Pathological Laboratory, answers:

"The trouble, from the description given, would seem to be due to a fungus in the soil that finds its way into healthy melon roots and by stopping up the circulatory pores of the plant produces wilting and death. A microscopic examination failed to show any fungus, but possibly a fair sample was not sent us. It might be, or course, a case of cut worms, but there is nothing present on vines to show this. The best remedy for the melon wilt is to grow a variety more reristant to this disease. If the correspondent will send us more material we could give more definite information regarding his trouble."

Removing Fruit From Young Trees.

I have orange trees planted a year ago, at that time year-old buds, and many of these young trees now have fruit. Should I take it off, or may I leave it without injury to the trees?—Subscriber, San Bernardino.

We would not allow trees of this age to bear any great quantity of fruit; now and then one will do no injury. The only point is that trees of this age should make wood rather than fruit. We have seen such trees bear, say a half dozen fruits, without any apparent injury.

Ground Squirrel Eradication.

I enclose clipping dated at San Jose in which it is stated that there are government and county inspectors engaged in the work of exterminating ground squirrels, also that all property owners are required to kill squirrels on their property within thirty days. Is there a state or other law which will compel cleaning up of places, especially of non-residents?—Subscriber, Covina.

There is a state law empowering county boards of supervisors to control this pest. We believe it is not within the jurisdiction of the county horticultural commissions, though they should be able to give you information as to how to proceed. The government officers are merely working in an advisory capacity; they have no power to compel your neighbors to clean up.

TULARE GRANGE.

At the recent meeting of Tul Grange Mr. Miot, Secretary of the lare County Board of Trade, gave address on the measures taken to mote the welfare of Tulare County, pecially by means of displays of var products. Mr. Miot has proven a p er as executive head of the Board Trade, and his work in showing county's productions has added to population.

Following Mr. Miot, Prof. Albee, perintendent of the Tulare Cou Schools, spoke of industrial and a cultural conditions. No state in Union has such possibilities as C fornia for advancement along th lines, and to the end that they may brought to the highest completion work should be begun in the scho of the state.

Mr. John Tuohy made an addr touching upon the history and acc plishment of Tulare Grange, fr which we quote:

In 1889 some little interest taken in the preservation and cons vation of our forests and streams. that time I met with much strong position from a class of men kno as timber grabbers. Such matters public interest do not always the public attention and support t deserve; they need the active supp of some well organized body. In t case Tulare Grange took the mat up, discussed it and called a meeti in Fresno to support it, appoint Hon. Tipton Lindsay to represent grange. The meeting was a succe Mariposa, Fresno, Tulare and K counties being represented. Reso tions favoring a forest reserve w passed and sent to the secretary the interior, ultimately resulting congress passing a law empower the president to withdraw from s forest land; as a result one of first withdrawals was the Sierra F est Reserve in the counties of M posa, Madera, Fresno, Tulare a Kern, containing 5,049,934 ac There are nineteen forest withdraw in California, the Sierra Forest serve being the first and as large the next three largest in the st combined.

The next effort of Tulare Gra was to get a body of giant sequo preserved from the timber grab and kept as a national park. In 1 there was but one township of gi sequoias that had not been grabb T. 18 S., R. 30 E., Mount Diablo B. M. This measure had the earn support of four active, patriotic n in Visalia, Hon. Tipton Lindsay, F. Walker, Geo. W. Stewart and Jo Tuohy. Had it not been for the w done by each and all of those men Sequoia National Park would ne have been. The bill creating the quoia National Park contains se townships in Tulare county and f sections known now as the Gen. Gr Park, two in Fresno and two in lare county.

The sequoia has no equal in world, growing at an elevation of fr fifty-five to seven thousand feet abo sea level. The park besides its equaled sequoias has many attr tions. Every American should v it. The best season to visit it is Ju July, August and September. Th its diversity of scenery, purity water, evenness of temperature a salubrity of climate are unequal Strange to say that whilst the pres vation of the beautiful timber and being kept as a park was the w of the four men I have named, no tree, a spring, a valley, a mounta a park or a meadow bears one their names on the maps of the partment.

The Tulare County Park o its preservation to Tulare Grange being a representative body of peo Forty years ago the delta of the weah had the finest body of oak t ber in the country. Very few of th are now left since the coming of railroad; it has consumed thousa of cords and other thousands of co have been sent out of the country firewood. An appeal was made to board of supervisors to buy and p serve one of the beautiful groves fore all was consumed as firewo The board of supervisors said t

For Rent—Twenty-five acres of the best early, nearly frostless land on Signal Hill. Three acres blackberries, two acres asparagus, glass house, etc. Plenty of water. Best local market, good wholesale trade. H. H. Hart, Box 304a, R. D. 1, Long Beach, Cal. Sunset Main 2042.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade, the live stock and poultry industries, are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

Fertile Eggs for hatching—Choice varieties. White Rocks, White Wyandottes and White Orpingtons at $1.50 to $4 per setting; $6.50 to $10 a hundred. Ducks—White Muscovy, Dark Muscovy, White Indian Runner, White Pekin, Buff and White Orpington, $1 to $3 a setting, $5 to $12 per hundred. Send for circular. Pheasants' eggs in season.

WICK'S WHITE FOWL FARMS Moorpark, Cal

SAGACITY.

One would have it that a collie is the most sagacious of dogs, while the other stood up for the setter.

"I once owned a setter," declared the latter, "which was very intelligent. I had him on the street one day, and he acted so queerly about a certain man we met that I asked the man his name, and——"

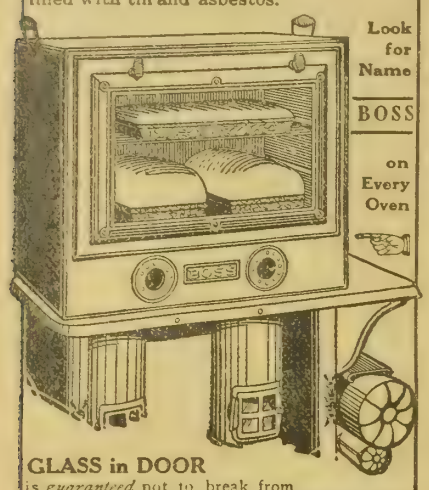
"Oh. that's an old story!" the collie's advocate broke in sneeringly. "The man's name was Partridge, of course, and because of that the dog came to a set. Ho, ho! Come again!"

"You're mistaken," rejoined the other suavely. "The dog didn't come quite to a set, though almost. As a matter of fact, the man's name was Quayle, and the dog hesitated on account of the spelling!"—Lippincott's.

CHEESE IN SOUPS.

In making soups, if your stock is not as rich as you wish, add one-half teacup or less of grated cheese. You will be surprised how greatly it will improve the soup. Save bits of cheese left over, grate and keep in a covered glass vessel, ready to use as wanted. —Woman's Home Companion.

USE A PORTABLE
BOSS OVEN
With Patented **GLASS DOOR**
on *your* stove or range, either oil, gasoline, acetylene, alcohol or gas.
No more spoiled bakings or worry—No more wasted heat—No more jarring or chilling of oven. Housewives can see their baking without opening door. Economy and convenience both guaranteed in the BOSS—a polished blued steel oven lined with tin and asbestos.



GLASS in DOOR
is *guaranteed* not to break from heat because it is secured by our patented *yielding pressure* retaining strips, which permit expansion and contraction. Glass door fits snugly in one-piece beaded front, and is held tightly in place with two turnbuckles, preventing escape of heat.
Baking qualities and ventilation superior to any other oven or range. All heat goes right into the open bottom, and is perfectly distributed to all parts of the oven by means of our patented Heat Deflector. Flame always visible through small mica windows. With the BOSS a baking costs *less than a cent*. It will many times over *pay for itself* in saved bakings to say nothing of saved fuel.
Ask YOUR Dealer to show you the BOSS Glass Door Oven. INSIST upon seeing the name "BOSS" stamped in the front of Oven. Then you know that it is genuine and *guaranteed*.
FREE: Our valuable Recipe Book, containing many cookery helps and full description of BOSS Ovens sent FREE on receipt of postal, plainly written, giving your own and your dealer's names and addresses.

Household Department

SEED TIME AND HARVEST.

As o'er his furrowed fields which lie
Beneath a coldly-dropping sky,
Yet chill with winter's melted snow,
The husbandman goes forth to sow.

Thus, Freedom, on the bitter blast
The ventures of thy seed we cast,
And trust to warmer sun and rain
To swell the germs and fill the grain.

Who calls thy glorious service hard?
Who deems it not its own reward?
Who, for its trials, counts it less
A cause of praise and thankfulness?

It may not be our lot to wield
The sickle in the ripened field;
Nor ours to hear, on summer eves,
The reaper's song among the sheaves.

Yet where our duty's task is wrought
In unison with God's great thought,
The near and future blend in one,
And whatsoe'er is willed, is done!

And ours the grateful service whence
Came, day by day, the recompense;
The hope, the trust, the purpose stayed,
The fountain and the noonday shade.

And were this life the utmost span,
The only end and aim of man,
Better the toil of fields like these
Than waking dream and slothful ease.

But life, though falling like our grain,
Like that revives and springs again;
And, early called, how blest are they
Who wait in heaven their harvest-day.
—J. G. Whittier.

MR. BASCOM GOES HUNTING.

"What on earth are you going to do!" Mrs. Bascom exclaimed, as she caught sight of her husband sneaking in the back way with a new repeating rifle under one arm and a belt with a hunting knife on the other.

"I'm going hunting," was the stammered reply, as the head of the house brought himself up with a sudden jerk.

"Which is it, Tom cats or trusts? The last time I believe you went after a bear which was supposed to be destroying Amos Walter's young orchard and, after you had sat all night in a tree watching, the bear turned out to be Kelley's goat. You——"

"I should think——"

"Well, why don't you?" Mrs. Bascom interrupted. "If you would only once in a while you would amount to something."

"Woman! Such language as that leads to the divorce court. You can't provoke me into a fight, nor can you persuade me to stay at home. I am determined to go." He dismissed the subject with a flourish of his hand, and entered the house.

"Well, well," Mrs. Bascom sighed, "I suppose he will go since he is so determined. I hope he has good luck on his trip, for——" An express wagon stopped before the house, and loaded up several boxes, which John briefly explained were for the camp.

All through the day, Mr. Bascom made his preparations. Twice he visited the stores, purchased a pair of boots and a revolver. Mrs. Bascom watched, but said nothing until after dinner.

"John," she asked, "when do you start?"

"Tomorrow," he replied. "Do you want to go along?"

"Me? I should say not! Do you think I'd risk my life while you were running around loose in the woods with your arsenal? Not me!" She shrugged her shoulders as if annoyed by the invitation.

"Very well," her husband remarked. "I shall go alone. A womans' a nuisance on an outing anyway."

"Oh! So you're glad I'm not going." Mrs. Bascom flared up. "A dutiful husband, I must say! Now for that I will go."

Early the next morning they started. Mrs. Bascom was ready, having packed her clothes on the previous evening. They drove in silence to the depot, where John bought the tickets. They had not long to wait before their train came in. But a few minutes more and they were off.

Mr. Bascom leaned back in his seat and smiled. "I'm glad you've come," he said, "because I could not get a cook, I don't like canned goods, and they would have been all I could have gotten." He beamed upon his wife affectionately.

For a moment Mrs. Bascom wished she had not come, as she thought of the clever way in which she had been fooled. Then, as he looked down upon her, her frown melted and she replied: "Yes, I'm glad I decided to enjoy the outing with you."

There was silence for several minutes. Then: "I've had good luck in getting a cabin," John explained. "It's right in the heart of the woods. Deer are plentiful, and"—he slapped his gun case—"I intend to get my share of them."

"I hope so; but I'm afraid——"

"Tut, tut. You don't need to be for I have hunted before."

"Yes," she replied. "I remember the time you sat in the tree all night, and——"

"Wildwood—Wildwood," the conductor shouted.

"Here's where we get off," John cried, glad of an opportunity to change the subject of their recent conversation. He grabbed his packages and left the train, his wife following.

A two hours drive brought them to their cabin. They arranged things, and made supper, after which they retired. "It's a dandy place," Mrs. Bascom murmured, as she viewed the landscape in the moonlight. "Just look at the river, John!"

"You will like the hunting even better." he exclaimed. "Tomorrow I will go after deer, and you can go along."

Despite the fact that they were very tired, they were up with the sun. A simple breakfast was made, and John, his Winchester under his arm, impatiently demanded that they start at once upon their hunt, after he had eaten but a few mouthfuls of food. Mrs. Bascom consented.

For two miles they walked in silence. Occasionally, John would halt and listen, then advance again with soft tread, motioning his wife to stand perfectly still. "Deer are wary," he exclaimed, "and it takes an experienced hunter to get 'em." Scarcely had he spoken when the brush cracked nearby, and a brown form disappeared in the bushes. Bang! Bang! Bang! the repeater spoke, and John, without stopping to eject the last empty shell, followed in the direction which the animal had taken. "I've got 'im! I've got 'im," he shouted to his wife as she overtook him.

"Yes," said a voice close to their side, as a man stepped into view. "You've got our mule, and it'll cost you one hundred and fifty dollars to settle."

"Who are you?" Bascom managed to gasp weakly.

"I am the foreman of a surveying gang," the stranger replied. "I heard the shooting, and came on the run, fearing you would kill some of my men. I found our mule dead behind those bushes. See"—he stepped forward a few feet, and pointed to the dead animal—"there is your deer."

Bascom glanced at the mule, then fished out a roll of bills. "Come," he said to his wife, as he paid over the money. "This is the darndest luck I ever had."

Mrs. Bascom smiled. "I remember once dear," she began, "when you sat all night in——."

He silenced her with a look.—Successful Farming.

PRACTICAL USES FOR OLD NEWSPAPERS.

Perhaps the most commonly known practical use for old newspapers is a covering for pantry shelves. They are easily folded to fit either large or small spaces and make the shelves look clean and neat with very little work.

Flatirons must always be well cleaned before they are put on light colored clothes, or the garments are sure to be soiled. A hard rubbing on several thicknesses of newspapers will leave the iron smooth and ready for use.

A very good way to prevent dust while sweeping a room is to sprinkle over the carpet a pan full of dampened newspapers torn into bits.

All of us haven't kitchen tables covered with oil cloth and so easily made clean and shining. In many homes

Copy of this book can be had at Southern Pacific office, Los Angeles.

there are hardwood tables which look beautifully white, but not until the housewife has spent several minutes with soap and the scrubbing brush over them. The hard scrubbings will be very much fewer if newspapers are freely used while the cooking and morning's work is being done.

Garbage, or refuse of any kind from the kitchen, is much neater and more sanitary if wrapped in newspapers before it is put in the can to await its disposal.

However clean kettles may be washed they are sure to leave a dark mark on the wall or woodwork against which they hang. Fasten up a newspaper wherever your pans or kettles may be hanging and keep your wall clean.

As you take the soiled papers from your kitchen table wrinkle them up and give the top of your stove a good rubbing and save blacking it for that day.

Newspapers are a most excellent non-conductor of heat. If they are put under the silence cloth in your dining room they will keep the warm dishes from injuring the polished surface of the table-top.

We all know what a difficult task it is to pack the heavy winter blankets and wraps during the summer so that the moths cannot get at them. Large bags made of several thicknesses of newspapers have been found excellent for this purpose. The ink used in printing seems to do away with the necessity for the use of moth balls or anything of the kind and the articles will be found free from any trace of a moth if the newspaper bag, in which they are stored, is tightly sealed.—Exchange.

MARK TWAIN SAID.

The true Southern watermelon is a boon apart and not to be mentioned with commoner things. It is chief of this world's luxuries, king by grace of God over all the fruits of the earth. When one has tasted it he knows what the angels eat. It was not a southern watermelon that Eve took; we know it because she repented.

It is easy to find fault if one has that disposition. There was once a man who, not being able to find any other fault with his coal, complained that there were too many prehistoric toads in it.

There is this trouble about special providences—namely, there is so often a doubt as to which party was intended to be the beneficiary. In the case of the children, the bears, and the prophet the bears got more real satisfaction out of the episode than the prophet did, because they got the children.

Whoever has lived long enough to find out what life is knows how deep a debt of gratitude we owe to Adam, the first great benefactor of our race. He brought death into the world.

Tell the truth or trump—but get the trick.

Adam and Eve had many advantages, but the principal one was that they escaped teething.

Adam was but human—this explains it all. He did not want the apple for the apple's sake; he wanted it only because it was forbidden. The mistake was in not forbidding the serpent; then he would have eaten the serpent.

The holy passion of Friendship is of so sweet and steady and loyal and enduring a nature that it will last through a whole lifetime if not asked to lend money.

Consider well the proportions of things. It is better to be a young June bug than an old bird of paradise.

Even the clearest and most perfect circumstantial evidence is likely to be at fault, after all, and therefore ought to be received with great caution. Take the case of any pencil sharpened by any woman: if you have witnesses you will find she did it with a knife; but if you take simply the aspect of the pencil you will say she did it with her teeth.

VERY STRONG.

"I see," said Slaters, "that our old friend Bilkins had a strong article in one of the Boston papers the other day."

"Really?" said Binks, incredulously. "I'd never have believed that of old Bilk. What was it?"

"A recipe for pickled onions," said Slaters.—Harper's Weekly.

$90,000 Daily

Now Spent for No-Rim-Cut Tires

Over 600,000 already sold—enough to equip 150,000 cars. All because they cut tire bills in two.

The sale of Goodyear tires has multiplied six times over in the past two years. Last year they jumped to $8,500,000. They are now running double last year.

Sixty-four leading motor car makers have contracted with us for these tires. To supply them and tire dealers we are running our factories twenty-four hours per day.

The reason lies in a patented tire—the No-Rim-Cut tire—10 per cent oversize. Men have found that this tire saves one-half on their tire bills. And the tire has become the sensation of motordom.

The No-Rim-Cut Tire

Here is the Goodyear No-Rim-Cut tire as it fits any standard rim. When you adopt this tire you simply reverse the removable rim flanges so they curve outward. They curve inward with old-style tires. This change can be made in ten seconds.

The rounded edge of the flange then comes next to the tire, and rim-cutting is made impossible.

No Hooks on This Tire

The ordinary tire—the clincher tire—has hooks on the base to hook into the rim flange. That is how the tire is held on. See the next picture.

When you use this type the removable rim flanges are set to curve inward. Note how they dig in when the tire is deflated: That is why the common tire will rim-cut if you run it flat.

Ordinary Clincher Tire

The No-Rim-Cut tire has no hooks on the base. It is held to the rim by flat tape, made of 126 braided wires, vulcanized into the tire base. These make the tire base unstretchable.

The tire can't come off because the base can't stretch. Nothing can force it over the rim. But, when you unlock and remove the rim flange, the tire comes off like any quick-detachable tire except that it won't stick.

The Ordinary Clincher Tire

This braided wire feature is controlled by our patents. And there is no other way known to make a safe tire which will stay on without hooks.

10% Oversize

These No-Rim-Cut tires, where the rim flanges flare outward, can be made 10 per cent over the rated size and still fit the rim. And we give you that oversize without extra cost.

That means 10 per cent more air—10 per cent greater carrying capacity. And that, with the average car, means 25 per cent more mileage per tire.

These two features together—No-Rim-Cut and oversize—will double the service one gets from a tire under average conditions. Yet Goodyear No-Rim-Cut tires cost no more than other standard tires.

GOODYEAR
No-Rim-Cut Tires

Our latest Tire Book, based on twelve years spent in tire making, contains many facts which motorists should know. Please ask us to mail it to you.

SQUARING THE FAMILY CIRCLE.

Smith walked up the street the other evening with a box of chocolates under one arm and a big package of meat under the other.

"Hello, Smith," said Brown, "gone in for housekeeping? I didn't know you were married."

"I'm not yet."

"What are you doing with those chocolates and meat, then."

"Going to see my girl."

"Do you have to furnish the family with meat already?"

"Oh, no; the sweets are for the girl and the meat is for the dog. I have to square both."—The Sacred Heart Review.

ODD.

That we should speak of wading through a dry brook.

That a fellow can be in a girl's presence and yet be "gone."

That the more we think of some people the less we think of them.

That we often speak of folks being at odds when they are really trying to get even.

That the more people we get to help us keep a secret, the sooner it gets away from us.

That saying a man is "capable of anything" is a very different thing from recommending him as thoroughly capable.—Boston Transcript.

WHY INDEED!

"What you see in that creature to admire I can't see," said Mrs. Dubbleigh. "Why, she's all made up. Her hair, her figure, her complexion—every bit of her is artificial."

"Well, what of it?" retorted Dubbleigh. "If the world admires self-made men why shouldn't it admire a self-made woman?"—Harper's Bazar.

A pint milk bottle makes a first-rate pestle in the absence of an ordinary one.

Hay.

Receipts of hay on this market for the past week were 4369 tons, as against 2600 tons last week and 2938 tons the preceding week. These receipts are abnormally large for this time of year, and we would judge that holders of hay have made up their mind to clean up before the new crop is available and before they are forced to pay another storage, as crop conditions are reported much more favorable, daily, and it now looks as though we would probably have very close to an average crop of hay, although some districts will, without a doubt, show a shortage, yet others look good.

Fancy grades of hay are still very scarce on this market, and what few arrivals there are of this description are easily placed to advantage. There is very little demand for the ordinary and cheaper grades of hay; it is extremely difficult to effect sales of this commodity even with heavy concessions in price.

There has been no new hay in during the past week with the exception of several cargoes of first-cutting alfalfa, which have been hard to dispose of at other than for stock purposes, prices ranging in the neighborhood of $6.00 to $6.50 per ton.

Cutting of the new crop is in progress in a great many sections.

Trade on both sides of the bay has been very quiet during the week, and with the exception of a little hay moved for export to the Hawaiian Islands, there is nothing of interest to note in this line.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	13.50@14.50
No. 1 wheat or wheat & oat	11.00@12.00
No. 2 wheat or wheat & oat	10.00@11.00
Choice tame oat	10.00@12.50
Other tame oat	8.50@10.50
Wild oat	9.00@10.00
Stock hay	6.00@8.00
Alfalfa	9.00@10.50
Straw, bale	.40@50

Grain.

Barley, fancy	1.36¼
Barley, good to choice	1.32½@1.35
Barley, poor to fair	1.27½@1.30
Oats, white	1.50@1.60
Rye, new crop	1.40@1.50
Mustard, brown	5½
Alfalfa seed	5½
Millet	2¾@3½
Flaxseed	5@5½
Broom corn seed, ton	25.00

Feed Stuff.

Alfalfa meal	17.00
Bran, ton	28.00@29.00
Feed cornmeal, ton	33.00@34.00
Cracked corn	33.00@34.00
Rolled barley, ton	28.00@29.00
Rolled oats, ton	29.00@30.00
Middlings	32.00@34.00
Oil cake, ton	40.00@41.50
Cocoanut cake, ton	25.50@26.50
Mixed feed, ton	25.00@27.00
Shorts	29.50@30.00

Deciduous Fruit Market

Sacramento, June 3, 1911.

The following circular is from Manager McKevitt of the California Fruit Distributors:

The following gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, June 2, 1911:

Cherries—22 cars. The cherry movement is now in full swing, with cars being forwarded from all the cherry shipping points in the state. In the early section Royal Anns, Bing, Tartarians and Centennials are going forward, while in the Santa Clara section the movement is restricted to the early varieties. In the Vacaville district this fruit will last for a week or ten days, but will probably be available from the Santa Clara districts for the next three weeks.

Apricots—One-fourth car. This fruit is now moving from Vacaville and Winters. Pringles are nearly done and Royals are increasing in quantity every day. There will be no considerable shipments, however, for another week.

Peaches—The early varieties of peaches are ripening. Like apricots, shipment will cut no figure for several days.

During the last week there has been no change in the fruit situation, except that all crops continue to look better and show increased quantity. Grapes are now blooming and promise to set well. Bunches are unusually large and fine, and the crop could not look better.

The cool, cloudy and threatening weather of the past few days has again changed and with the advent of sunshine and congenial warmth, we anticipate the more rapid ripening of fruit, which the growers of California and the eastern trade are both anxiously awaiting.

Citrus Fruit Market

LOS ANGELES, June 7, 1911.

A material improvement is noted in the orange situation, which was noted last week as decidedly easy. At that time some 1300 or 1400 cars were being forwarded every week, while last week only about 800 went forward, and this, together with rather better fruit and improved market conditions, is helping matters greatly. Valencias are the principal shipment now and excepting for the sizes running small, exceedingly fine fruit is going forward.

In lemons, the foreigns are anticipating the high prices preceding the Fourth of July and are now coming in a greater quantity than for months, but the hot weather prevailing over the entire East is absorbing everything and satisfactory prices are being obtained. It is not thought the foreigns will be in heavy enough receipts before July to break the market at all.

Shipments.

Total shipments of oranges to date since November 1st, 30,019 cars, lemons 4,142, total 34,161. To same date last year, oranges 20,680, lemons 2,763, total 23,443.

LOS ANGELES, May 31.—One car Valencias, two seedlings, two lemons sold.

TULARE ORANGE.

(Continued from page 698)

would do so if the people of the county wanted them to. Tulare Grange passed resolutions strongly advocating the purchase and preservation of one of the few remaining groves. These resolutions were brought before the county board of trade and presented to the board of supervisors who said they would do as the resolutions requested, if they had a legal right to do so; the district attorney was appealed to and said the law authorizing supervisors to buy grounds for courts and hospitals did not provide for parks, but it might be amended. Senator E. O. Miller, then a member of the state senate, was then appealed to at the next session of the legislature. He formulated the amendment, introduced it and had it passed. The board of supervisors two years ago bought the Mooney Grove. It is central in the county, comprising one hundred acres, has a beautiful creek running through it. The supervisors will eventually add to its beauty and its attractions.

HINDI COTTON IN EGYPT.

That the requirements of the cotton goods industry necessitates the importation of approximately 60,000,000 pounds of Egyptian cotton, costing $16,000,000, is probably unknown to the majority of readers, who read of the enormous crops of cotton produced in our Southern states and learn that during the last seven months all records have been broken and practically $500,000,000 worth of that staple has been exported.

But it was the considerable value of this import that induced the United States Department of Agriculture several years ago to endeavor to develop Egyptian cotton culture in the United States in order to supply our own market with a home-grown product.

Although experiments were made at different points from South Carolina to Texas, as well as in Western Texas, New Mexico, Arizona and Southern California, it was only in the Colorado River region that climatic and other conditions similar to those in the Nile Valley, and suited to the long staple Egyptian cotton, were found. There 600,000 acres of excellent land are, or soon will be, under ditch in the Imperial, Yuma, Salt and Gila Valleys, and one-fifth this acreage could produce the amount of Egyptian cotton annually imported for the use of New England mills.

For several years studies and experiments with the various Egyptian varieties have been undertaken in Southern Arizona, Southeastern California and Egypt, and several bulletins have been issued giving detailed reports of the progress made and success achieved.

Just now the Department has issued another pamphlet (Bulletin 210, Bureau of Plant Industry), reporting the results of a visit to the cotton-growing districts of Egypt in June and July, 1910, of the bionomist of the Department, in which it is shown that the mixture of Hindi cotton is proving to be a serious burden upon the Egyptian cotton industry. Hindi is the name applied in Egypt to an undesirable type of cotton with a short, weak fiber, that injures the high-grade Egyptian varieties by infesting them with hybrids. The introduction of the Egyptian cotton into the United States brings also the problem of the Hindi cotton, and the practicability of establishing a commercial culture of the Egyptian cotton in the United States depends largely upon the elimination of Hindi contamination and other forms of diversity, so that the fiber may be produced in a satisfactory condition of uniformity.

Breeding experiments have shown that it is possible to secure a much higher degree of uniformity in Arizona than now exists in most of the cotton fields of Egypt. If reasonable care be used in maintaining the uniformity of these types, it does not seem that the American-grown Egyptian cotton is likely to suffer any commercial disadvantage on the ground of lack of uniformity, even though the Egyptian habit of hand-sorting is not followed.

The exclusion of the Hindi cotton by an efficient system of selection will enable white varieties to be grown producing longer and stronger fiber than the brown varieties are likely to afford, and will further the development and preservation of uniform strains of Egyptian cotton in the United States.

THE DIMINUTIVE.

At the age of three Janet was an enthusiastic student of entomology. One day she discovered a caterpillar for herself, a very tiny one. "Oh, come here!" she called. "Here's a caterpillar, the cutest little thing! I believe it's a kittenpillar!"—Woman's Home Companion.

A CRUEL DIFFERENCE.

Frost—"What's the difference between a debutante and a suffragette?"

Snow—"About twenty years."—Woman's Home Companion.

A GOOD LAWN MOWER.

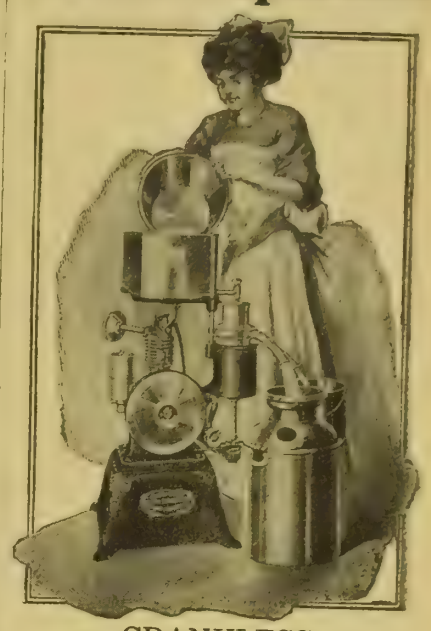
The handsomest feature of California's landscape is a well cared for lawn, and it may also be added that it is one of the most difficult features of California gardens. Our mild climate induces the growth of all kinds of pests, which dispute with blue-grass and clover for possession. Perhaps the worst of these is Bermuda, but the result is worth the effort and every home should be surrounded, or at least have some patch of green. After the soil has been put in the best condition, pests kept down and lawn produced, it is unfortunate to lose its highest value by indifferent clipping. We have seen them grow until they became so tall that the good old-fashioned scythe is brought into use and they are "mowed," but with the modern lawn clipper there is no excuse, for good ones may be had at a moderate cost. These are put up from those which are almost "midgets" up to the "pony," and even the power mower.

One of the best of these mowers is that put up by the Clipper Lawn Mower Co. of Dixon, Ill. They make announcements in another column of their line of machines, and we would advise Cultivator readers to get in touch with them and learn regarding this most desirable addition to the gardening tool. The motto of this concern is to give the people the best they can get for the money.

MODERN IRRIGATION METHODS.

The "K. T." Brown Book, a little 80-page brown-covered booklet, filled with irrigation information, especially pertaining to modern irrigation methods, has been issued by the Kellar-Thomason Manufacturing Co., 1222-1236 E. Twenty-eighth St., Los Angeles. The Kellar-Thomason people are the manufacturers of various forms of irrigation pipes and flumes, and especially of the "K T" valve, which is almost an automatic control for irrigation water. Water is too expensive in California to be wasted, and a little money invested in appliances, if it will only save this valuable water, pays big interest. The method of installing these appliances so as to save irrigation water is shown in text and illustration in this booklet, which is well worth the writing for. Mention The Cultivator and ask for it.

AUTOMATIC
Cream Separator



CRANKLESS
and GEARLESS

Nothing like it has ever before been invented. One size machine for any size dairy. The drudgery of dairying now a thing of the past.

It separates the milk perfectly faster than ten men can milk it.

Start the separator when the milking begins and it being both automatic and continuous in its operation, when the farmer is through milking he is through skimming.

Speed of bowl brought up in 15 seconds and will run for hours without the slightest variation.

It is destined to revolutionize the dairy business.

We are at least FIVE YEARS ahead of all competitors.

Cotton King Disk Harrow

This harrow is symmetrical in design and strong enough to withstand the heavy work which a disk harrow encounters in a field. It is equipped with three steel standards, which insures great strength and will not clog when working over freshly-plowed ground or among clods. It will work equally well in any condition of soil, no matter whether the field is sandy or soggy. The gangs respond promptly to the levers so that the driver can easily adjust the disks to work at any desired angle. The frame is high and the disks can be so extended that there will be ample room for passing the plants when using the harrow as a cultivator. The levers do not extend below the tongue where they would interfere with the plants being cultivated. This disk harrow is just what you need. Come and investigate.

California Cultivator

Vol. XXXVI. No. 24. LOS ANGELES: THURSDAY, JUNE 15, 1911 One Dollar the Year

Is the Horticultural Law Constitutional?

State Horticultural Commissioner J. W. Jeffrey Discusses the Law Empowering County Horticultural Commissioners to Eradicate Pests Affecting Agriculture of This State. The Law is Constitutional and Will be Enforced.

In a late issue of the Cultivator, Prof. C. W. Woodworth discusses the county horticultural law in connection with the effort now being made in Los Angeles County toward the suppression of the peach aphis. If his contention in regard to the constitutionality of the law is correct, the law should either be abandoned or made to conform to constitutional principles; if his contention is not well founded, a discussion of the law as it is may be of some value to your readers. At any rate, the subject of horticultural legislation is of great interest to the people who are in any way connected with the fruit industry, and the questions concerned with it should always have careful consideration.

The foundation of Prof. Woodworth's contention is that the county horticultural law contemplates the eradication of insect pests; eradication being impossible, there is no lawful basis for the application of compulsory treatment that merely lessens the number of pests; eradication is the intent of the law, and also impossible, and there is an axiom that no law can require the impossible. Hence, and for other reasons, the act is unconstitutional. The mere fact that it has been applied, liens filed and collected under these conditions, does not establish its validity. Prof. Woodworth asserts further that the difficulties surrounding the pest question could be largely avoided if the county assumed the financial responsibility of the work. It is probable, also, he says, that it would be better to provide for its continuance under a county ordinance, thus avoiding a fundamental unconstitutionality of the state law which has never been adjudicated but which many have known to exist. With the proper county ordinances, this whole question of constitutionality could be eliminated.

Furthermore, he says, the law has been drawn upon the analogy of quarantine laws governing health officers. "Where property alone, and not life, is at stake, any attempt to create laws permitting the destruction of property without due process of law and without suitable indemnity would certainly not be held to be constitutional if the question came before the courts."

The errors into which Prof. Woodworth has fallen are plain. In the first place, the county horticultural law has been subjected to the most severe test in the supreme court of this state. The briefs which have been submitted in opposition to the law upon every conceivable point by the attorneys employed to defeat it presumably have covered every point of attack. The supreme court of the state after the most thorough consideration has declared this law constitutional, and I am at a loss to know what he refers to as the "fundamental unconstitutionality which many have known to exist." On November 11, 1899, and again on July 5, 1901, the supreme court reviewed every element of this law, sustaining the act in every particular. The latter was the celebrated Riverside case in which the court stated that the constitutionality of the law as a whole had been so well established by a former supreme court decision that it was not necessary to discuss this phase of it further. Specifically these two cases determined the following points: That every provision of the act is germane to the subject matter expressed in its title; that the horticultural commissioner has the power to determine whether any orchard infestation is a nuisance, and that he exercises police and not judicial power in determining and abating it; that a lien filed against property for abating a nuisance of this character is not in the nature of a delinquent tax, but it is to satisfy a just indebtedness to the county and the enforcement of the lien under the horticultural law is not unconstitutional. Furthermore, the court upheld the provisions of the law as to form of notice, as to the methods of giving notice of insect infestation, itemizing the bills for the work, and every other provision called in question by the suit. In denying the validity of every objection raised by the defendants in the Riverside suit the law seems to have been vindicated in every particular. If there had been any basic defects in the act, the score of able lawyers who have fought it in the past would certainly have discovered the fact.

The law neither contemplates nor permits "the destruction of private property without due process of law." It does not destroy property at all but protects and conserves it. This fact is subject to absolute proof before a court, and when a lien is filed the law prescribes specifically that it can be satisfied only after investigation of its merits in court. This provision prevents any invasion of rights and precludes indemnity if the facts of beneficial results can be proved, whether the insect pests are eradicated or not. Again, the horticultural commissioner is liable personally and officially for wrongful acts done under color of his office and is obliged to give bonds in the sum of one thousand dollars to cover all possible delinquencies.

Prof. Woodworth also states that "The health laws stand in striking contrast with the whole body of constitutional laws, finding their only parallel in the acts permitted during actual war." But the supreme court says that the health acts are a part of the constitutional law of the land and hence they cannot be separated for the sake of argument. A police power has been declared as fundamentally constitutional as judicial or legislative power and is in fact only executive power conferred specifically by the law and supported by the highest courts in this interpretation. This power is not in violation of either common or statutory rights. The supreme court of the state has specifically classed the horticultural act in question with the health, retail liquor, street-speaking, drum-beating, food inspection and other police and yet statutory regulations. "All such laws," says the court, "have been judicially held to be valid. They confer the same power upon designated public officers as is given to the horticultural commissioners."

The law first declares the infestations of orchards, trees, plants, lands, etc., by harmful insects and noxious weeds, to be public nuisances. This declaration, standing alone in the law would doubtless be an unconstitutional provision. But the law provides for the inspection of all orchards, plants, premises, etc., in order that the county commissioner may by proper examination determine whether any particular place is a nuisance, and the supreme court has declared that the commissioner may rightfully exercise this discretion in so determining. In carrying into execution any police regulation it must be done in a prompt and summary manner, or at least the power to do so must be given, and the horticultural law does not transcend any right in giving the commissioner power to abate insect nuisances "in a summary manner." But even this strong power is limited by the act itself, as the law provides a day in court for the adjustment of damages or inefficiency in the abating of the nuisance.

This brings us to the point as to whether the law contemplates "the eradication of insect pests." In the Riverside case, the defendants demurred, stating that the cause of action did not set forth whether all or only a part of the defendant's orchard was infested with scale; that the complaint did not indicate to what extent the scale was "eradicated," or that it was eradicated at all. The supreme court overruled all these objections and ordered the lower court to overrule the whole demurrer. The court required no evidence that the scale had been exterminated, and I believe the highest courts in the future, if it is tested, will rule that an earnest, intelligent attempt to abate the cause of an orchard nuisance—to lessen, suspend or stop the progress of an insect pest—is compliance with both the spirit and meaning of the law.

Even should the courts subject the language of the law to strict construction, the word "abate" ocurs oftener than the word "eradicate" and apparently with more importance in its relation to the powers attempted to be conferred by the act, and the word "abate" is used with the most liberal construction throughout the two decisions of the supreme court and also throughout many decisions rendered by the superior courts of the state in relation to the same law. Very few laws are interpreted strictly upon the literal significance of certain words, when the whole purport of the act may be plainly in opposition to the significance of certain of its terms.

As to the proposition of placing the whole subject of insect control under supervisorial ordinances, the attorney general has declared that such ordinances now existing are not legal. In one case a superior court has abrogated one of these county ordinances. Before the supervisorial ordinance could become lawful the present horticultural act would have to be abolished. Even if that could be done, I cannot see how a county ordinance could overcome constitutional difficulties that cannot be avoided by a statutory law.

Our horticultural laws are not perfect by any means, nor will they ever be. The best way, however, to improve them is not by vague criticism. Improvement can only be made by constructive work, by drawing up bills embodying the best principles and the most workable plans. The legislature will readily enact any good bill of this character and the governor as readily give his approval.

Citrus and Tropical Fruits

CITRUS CULLS AS FERTILIZER.

By G. Ross Robertson.

Might I add a little—as an amateur and perhaps but a theorist—to the old discussion on the value of citrus culls as fertilizer.

Judging by Professor Colby's investigations, orange culls do not contain enough nitrogen, potash and phosphorus to pay for a mule to haul them into the orchard, let alone paying the wages of a man to spread them as fertilizer. Moreover, Washington authorities warn us against the possibility of introducing too much acid, with a chance of encouraging root rot, or of infesting clean orchards with somebody else's scale-ridden fruit. In spite of this, a novice often thinks that there can surely be no fertilizer that could replace in the soil the "exact materials" necessary to make new fruit, such as the culls of that self-same fruit. He of course forgets that the fruit of the orange, as with most other fruits, is composed of almost nothing but carbon and a very large proportion of water. The water we don't need (if we irrigate properly), and the carbon simply does not get into the tree through the medium of the roots; and the only direct "fertilizer" is a minute fraction of a per cent of nitrogen, phosphorus and potash. The argument is thus rather hard on the cull orange.

In accordance with these experiment station ideas, various packing associations about Redlands are going to considerable expense to haul their culls to the Santa Ana wash dump and other equally harmless places. But to get to the point of this dissertation: it happens that one of these associations has been dumping culls for some time on a near-by piece of land seeded this season to barley hay. The results of this accidental experiment at Mentone seemed to me to be especially interesting. Like much of the valley soil, this hay field is of very light sandy loam, and lacking in humus, as might be expected. The culls had been scattered at random over the area, quite heavily in some places. In every spot where the fruit had lain the effect on the grain was astonishing. Where the application had been too thick, the mower was not able to cut the hay on account of the over-rank growth. Obviously the culls could have been spread over a much wider area, and the results been more moderate, and of more real value.

If orange culls are chemically so nearly worthless as a "direct" fertilizer, does it not seem rational to place more emphasis on the indirect value of the humus that we can derive from them? There are many who are beginning to think that we should pay attention to modes of getting otherwise unavailable materials out of our soil, as well as patronize the nitrate of soda industry; and perhaps orange-cull humus, acid, water and all, can help us at that job.

There will be many who admit that the culls might boost this hay crop, but who will not agree that the cash value of the result is commensurate with the effort of application, etc. Perhaps that is to a degree true; but at any rate is it business sense to pay out a goodly sum of money to hire men to carry culls long distances to a dump where they only cumber the landscape? If you are bound to pay out good cash to move this sort of stuff, why not put it where some future crop may profit by it? Possibly it is not wise to plow them into citrus orchards, but there are certainly other agricultural enterprises where they could be of value. In our open, free aerated California soils, literally reeking with bacteria, it will be some time before we can "sour" the land by the use of such fertilizers.

INCREASING USE OF FERTILIZERS

Soil foods seem to be rapidly gaining in popularity or absolute requirement, or perhaps both, among the agriculturists of the United States. The total value of imported fertilizers, including materials largely though not exclusively used for that purpose, aggregated $40,000,000 in the calendar year 1910, against $10,500,000 in 1900 and $5,500,000 in 1890, according to figures compiled by the Bureau of Statistics of the Department of Commerce and Labor; while other reports covering the production of fertilizers indicate also a large and perhaps equally rapid growth in domestic output of the various materials used for fertilizing purposes. The production of phosphate rock, for example, largely used in the manufacture of artificial fertilizers, has increased, according to reports of the Geological Survey, from $6,500,000 in 1904 to $10,750,000 in 1909; while the Census Office reports the value of fertilizers manufactured in 1890 at $39,000,000, in 1900 at $45,000,000, and in 1905 at $57,000,000, and if the rate of increase just shown with regard to the production of phosphates, a basic material in the manufacture of fertilizers, occurred also in the output of manufactured fertilizers during the period since 1905, the total production in 1910 was probably $70,000,000. Meantime the United States exported last year fertilizers to the value of $10,000,000, making the approximate consumption of soil foods by the farmers of the country about $100,000,000 per annum, omitting consideration in this connection of cotton-seed meal, used in part as fertilizer material, but largely as a food for live stock.

The increase in importation of the more important classes of articles used as fertilizers is indicated by the following figures. Imports of soda nitrate, or Chile saltpetre, have increased from $3,000,000 in 1890 to $5,000,000 in 1900, and to over $16,500,000 in the calendar year 1910. The imports of potash salts of the fertilizer class, chiefly the muriate and sulphate, have increased from $1,00,000 in 1890 to $2,000,000 in 1900, and six and two-third millions in 1910; while imports of phosphates, guano, kainit and other fertilizers have increased from over $1,000,000 in 1890 to $2,000,000 in 1900, and $9,500,000 in 1910.

The commercial sources of the elements chiefly relied upon as soil foods—nitrogen, phoshoric acid and potash—are comparatively few. Nitrate of soda, valuable because of its high content of nitrogen, comes almost exclusively from Chile, from which the imports amount to over 300,000 tons, valued at about $13,000,000 per annum. The potash salts are practically all the product of Germany, the imports therefrom of muriate of potash, valuable by reason of its richness in available potash, ranging from 200,000,000 to 400,000,000 pounds, valued at from $3,000,000 to $5,000,000 per annum. The imported sulphate of potash also comes chiefly from Germany, though smaller amounts are imported from Belgium, Austria-Hungary and Japan. Imported guano comes from a considerable number of countries, though mostly from Peru and Germany, smaller amounts being imported from the United Kingdom, Mexico, Netherlands, the Dutch West Indies, and, in some years, from Uruguay, Venezuela and British possessions in Oceania. Of the imported crude phosphates, Belgium, French Guiana and British Oceania are the chief sources; while of the other imported fertilizers not separately enumerated by the Bureau of Statistics, Germany is the chief source, supplying from 70 to 80 per cent, the remainder being chiefly from the United Kingdom, Canada and Belgium.

Additional evidence of the increased consumption of artificial fertilizers in the United States is contained in the figures of the census, which show that the number of establishments devoted to that purpose has increased from 278 in 1880 to 553 in 1905; the tons of material used, from 727,453 to 3,591,771; and the value of their product, from $20,000,000 in 1880 to $57,000,000 in 1905. The materials used by the domestic fertilizer industry in 1905 included bones, tankage, etc., $5,000,000; phosphate rock, $4,500,000; potash salts, $3,500,000; superphosphates, $3,000,000; cotton seed meal, two and one-third millions; pyrites, $2,000,000;

kainit, nearly $2,000,000; nitrate of soda, $1,750,000; sulphuric acid, $1,000,000; fish, nearly $1,000,000; ammonia sulphate, a little over a half million; and various other articles, such as sulphur, lime, wood ashes, and salt.

ANOTHER BENEFICIAL INSECT.

Regarding the newly imported insect which it is hoped will aid in ridding black scale ridden trees of the pest we have asked Superintendent E. K. Carnes of the State Insectary for a statement, and he writes:

"We made arrangements with Professor Charles Lounsbury, government entomologist, Union of South Africa, who sent us the Scutellista cyanea, to prepare shipments of black scale infested plants that have been parasitized in the half-grown stages by the internal Hymenopterous parasite Aphycus lounsburyi and sent in various ways to the state insectary.

"The control of black scale by parasites in South Africa is complete, and the species we are now trying to establish in California works in conjunction with the Scutellista cyanea. It possesses this advantage over the Scutellista, that it attacks the scale in all its stages up to the egg stage, consequently it has a much wider range of activity, and can work in the inland where we have a more even hatch of the black scale.

"The first shipment received by parcels post came through in good condition. From this lot over five hundred flies have issued. The second shipment is now in San Francisco, passing through the customs department. This lot was shipped in cold storage. Additional shipments will follow throughout the season.

"I have taken a shipment and personally liberated them in the vicinity of Los Angeles on pepper trees, and have made arrangements to have additional colonies placed in various centers.

"This species will not be available for general distribution for some time, as I wish to thoroughly try them out before offering them to the public.

"I might also add that we have imported other species from China and the Philippine Islands for the same purpose. Aphycus lounsburyi works on the black scale in the same manner as Coccophagus lecani works on the soft orange scale with which most of our growers are familiar.

"With regard to what we expect it to do—we know what this species combined with Scutellista has done in South Africa, and are trying to duplicate the work under California conditions, and the policy of the insectary is to bend every effort towards controlling our destructive pests with their natural insect enemies, and to prove what they are capable of doing before making any statement as to what they are going to do."

Irrigation Engineer C. E. Tait, of the Division of Irrigation, Department of Agriculture, writes the Cultivator regarding Bulletin 236, which, as its title would indicate, has to do with irrigation in Pomona Valley. The author says: "Pomona was selected as a typical district in the citrus belt for investigations." Many of the methods and points given in this book apply to all parts of the state. It is a valuable booklet, and should be applied for either to the Division of Irrigation Investigations, Berkeley, or the Department of Agriculture at Washington.

California shipped nearly 8,000 carloads of citrus fruits in the month of March this year, and not only did not glut or break the prices in any market, but in fact increased the price steadily throughout the entire month.

Three things made this possible—ripe fruit, the wonderful advertising campaign carried on by California, and the California Fruit Growers Exchange.—Florida Grower.

Santa Barbara County is working for a permanent highway through the forest reserves and over the Coast Range to Bakersfield. It is hoped the government will join in the work in the interests of fire protection.

The fruit growers of Elsinore Valley, Riverside County, have perfected a co-operative marketing organization with F. C. Lillie President, and A. R. Moore Secretary.

Krogh New Type Vertical Water Balanced Pump

This Pump

Will Interest the Irrigator

Pump has Water Sealed Gland, Enclosed Balanced Impellor. Will not cut out by sand. Can be placed in a smaller pit than any other pump. Our Bulletin, C12, tells all about it. The pump can be seen in operation at our places of business. We have a permanent branch house at

Deciduous Fruit Culture

PACIFIC COAST NURSERYMEN'S ASSOCIATION.

The Pacific Coast Nurserymen's Association will convene next Wednesday morning, June 21st, in Odd Fellows Hall, San Jose, at 10:30. President George C. Roeding of this state will preside. Mr. Roeding and a bunch of San Jose boosters have been working like nailers to get things in shape for this convention, and a big attendance is anticipated from all portions of the Pacific Coast. A special train is to leave Portland on the 18th and nurserymen from all over California are expected to turn out in large numbers. A long list of addresses on topics of interest to nurserymen and orchardists has been prepared and two social afternoons are provided for. At the opening at 10:30 Wednesday, June 21st, the usual mayor's address of welcome and greetings from the Chamber of Commerce with response by P. A. Dix of Utah, together with appointment of committees will fill the morning session. In addition an address will be made by C. J. Atwood of Toppenish, Washington. At the reconvening at 1:30 President Roeding will make his annual address and other features of the afternoon session will be:

Nurserymen and Horticultural Authorities, M. McDonald, President Oregon Nursery Co.; Discussion, Jno. S. Armstrong, Ontario, Cal., and E. P. Watson, Clarkston; Insurrecto Nurserymen, J. W. Jeffery, Horticultural Commissioner California; Discussion, A. McDonald, Orenco, Ore., and Max J. Crow, Gilroy, Cal.; Attitude of Nurserymen Towards Horticultural Laws and Inspectors, S. A. Miller, Milton, Oregon; Discussion, Almon Wheeler, San Jose, C. J. Atwood, Toppenish, Wash.. Question box: Is it practical to save growing nursery stock in the spring months by the use of fuel pots and by smudging? Is it a good practice for nurserymen to publish prices in the papers in which they advertise? Is the crown gall on the apple less frequently found when the trees are budded than when grafted?

Morning Session, June 22:

Thursday morning: Why the Nurseryman should stand in the position of an Educator to the Fruit Growers, Prof. E. J. Wickson, Berkeley, Cal.; Discussion, A. Brownell, Portland, and Ray I. Hartley, Emmett, Ida.; Grading Nursery Stock, C. F. Breithampt, Richland, Wash.; Discussion, O. R. Hayes, Lewiston, and H. A. Lewis, Portland; Plans for Growing and Keeping Nursery Stock, A. McGill, Orenco, Ore.; Discussion, L. R. Cody, Saratoga, and C. F. Breithampt, Richland; Apple Seedlings in the Northwest, A. W. McDonald, Toppenish, Wash.; Discussion, H. S. Galligan, Hood River, Oregon, and Q. Lingham, Puyallup, Wash.; Rural Out of Door Adornment, Johannes Reimers, Stockton, Cal. Question box: What constitutes a nurseryman's agent? What is the best preventive for wooly aphis on apple in nursery trees or seedlings? Should this association act as a protective agency as against adverse legislation in regard to quarantine laws, and how? Half hour informal conference with Luther Burbank.

Thursday afternoon the Nurserymen's Association will be the guests of the Chamber of Commerce on a trip to Congress Springs, Los Gatos, Saratoga and Campbell.

On Thursday evening the protective association will hold its session.

Friday morning session, 9:30 a. m.: The Nurseryman, a Pioneer, P. A. Dix, Roy, Utah; Discussion, W. R. Wood, Exeter, and C. P. Taft, Orange; Pedigreed Stock, Does it Pay? Leonard Coates, Morganhill; Discussion, H. M. Lichey, Sunnyside, Wash. and D. D. Campin, Ceres; Virtues and Faults of Different Kinds of Pear Stock, N. S. Bennett, Medford, Ore.; Discussion, W. S. McClain, Sunnyside and J. A. Pilkington, Portland, Oregon; Wild Flowers of California, Theodore Payne, Los Angeles; Discussion, C. W. Howard, Hemet, and John Vallance, San Francisco; Early Nursery Reminiscences by J. Q. A. Ballow, G. W. Tarleton. To what extent is it possible and practicable to distinguish varieties of trees in the nursery? What should define the line between the reputable and disreputable dealer?

Friday afternoon the attendants are invited by Mr. W. V. Eberly to be the guests of the California Nursery Co., at Niles.

PRECOOLING OF FRUIT.

By A. V. Stubenrauch, Expert Acting in Charge of Field Investigations Bureau Plant Industry.

The "Lodi Sentinel" of April 12th publishes what is presumably a copy of a circular being disseminated by the Pacific Fruit Cooling and Vaporizing Company which contains statements giving the impression that I have recommended the patented process of that company as being the one system of precooling which has been found to work with perfect success. This statement is given as a part of arguments which are said "to be adduced" from statements made in a paper on the precooling of fruit which I prepared for the convention of the Western Fruit Jobbers' Association held at Sacramento, Cal., last February. I am not prepared to say that the use of the statements in the way indicated above was at all intentional on the part of the company, but they have been interpreted as a recommendation from me, and in justice to the work of this bureau and to the fruit interests of California I deem it advisable to correct any misunderstanding or misconceptions which may have resulted from the publication and dissemination of the circular in question.

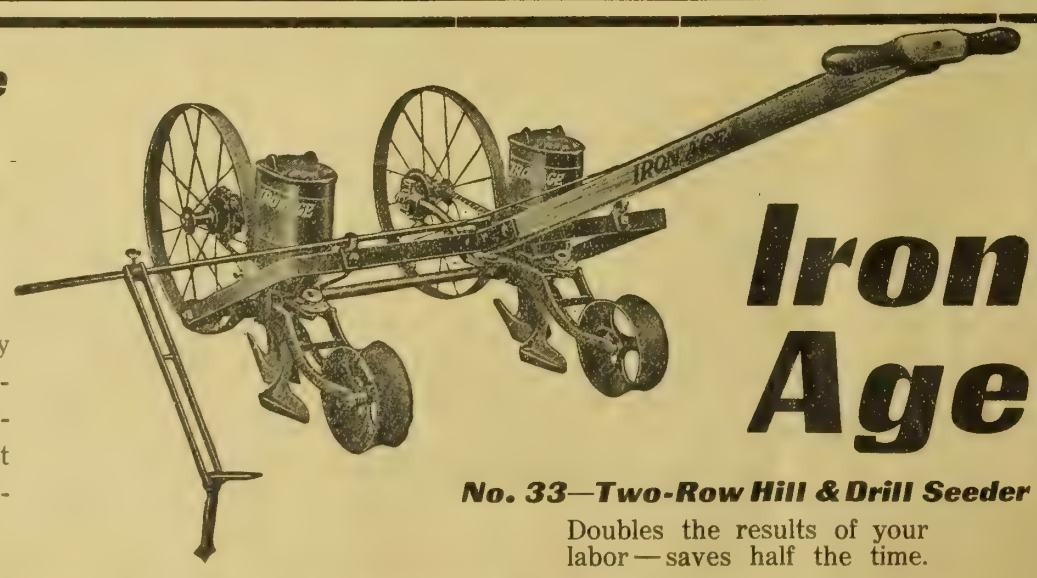
We have not yet gotten to the point in our investigations where it is possible to recommend any particular precooling system as being the one adapted to all conditions, and to recommend any particular patented process is wholly out of the question.

Many problems connected with the precooling of fruit still remain unsolved; in fact, this method of preparing fruit for shipment cannot yet be said to have gone far beyond the experimental stage. The bureau of plant industry investigations are being continued and have in view the working out of the various problems connected with the cooling of fruit, and the data and information gained from these investigations will be made available to the fruit industries as rapidly as consistent and accurate results are obtained.

Among the so-called arguments stated in the circular of the Pacific Fruit Cooling and Vaporizing Company are the following statements:

Iron Age Wheel Garden Tools

are well made, easy to operate, accurate and simple. Illustrated booklet sent free on request.



Iron Age

No. 33—Two-Row Hill & Drill Seeder

Doubles the results of your labor—saves half the time.

Newell Mathews Company

Los Angeles Established 1886 California Stockton

"Green fruit shipped under ice alone cannot arrive on a distant market in a uniform condition.

"The delay incident to any system of precooling after the fruit is loaded into the car nullifies whatever benefit might otherwise accrue.

"Warehouse precooling, while much to be preferred to immediate shipments of fruit under ice alone, or to precooling after loading into the car, is open to the serious objection of expending several days of the short life span of the fruit at this end of the line, whereas if made available at the other end of the line would mean wider distribution and better profits to the producer."

The above statements as submitted are evidently based upon a misconception or misinterpretation of the statements made in my paper and are in consequence erroneous deductions. It would not be safe to say that green fruit cannot be carried in uniform condition under ordinary methods of refrigeration. Under certain conditions, green fruit shipments are being carried safely without precooling, and precooling as such is not a panacea for all of the difficulties encountered in the transportation of green fruits over long distances. The type of handling given the fruit and the promptness with which its temperature is reduced are the most important factors governing the behavior of the products in transit.

The delay mentioned in the second paragraph quoted refers to delay in applying the cooling process and is important with any system of precooling, including one under discussion. Delay as applied to car precooling mentioned in my paper referred to the delay incident to the assembling of cars or to the hauling of the fruit and loading either in cars or in precooling rooms. It is not the delay incident to the limitations of any system itself, but delay in securing prompt reduction of temperature. We have never asserted that it is impracticable to precool after loading in cars, and the argument as above stated is, therefore, wholly erroneous.

In the third paragraph quoted the impression is given that to precool fruit in warehouse rooms requires several days. This is erroneous. Even in the case of oranges, which are wrapped and tightly packed in boxes, and which have proved to be the most difficult fruits to precool which we have had thus far under observation, the time necessary to reduce the initial temperature of the fruit to the desired point in ordinary cold storage rooms not fitted with any special facilities for precooling, was not over 36 hours. Fruits such as peaches, grapes, and others, which are not so closely packed and tightly wrapped, cool more rapidly, and it is safe to say, will not require nearly as long a time as oranges.

Promptness is the most important factor in precooling operations. Any system which requires considerable time between the packing of the fruit and the beginning of the precooling process may nullify any benefit to be obtained so far as condition and carrying quality of the fruit are concerned. After the temperature of the fruit is lowered to the point where decay is checked and ripening arrested, time ceases to be an important factor within certain limitations. If this were not true, the extension of the marketing area of fruits by precooling would not be practicable.

IMPORTING PLANTS FROM PEST INFESTED COUNTRIES.

The desire to introduce new plants which may be of value to individual and to state is laudable, and has been the means of the bringing to California of some of our most valuable producers. It has also been the means of bringing some pests which have cost thousands or even millions. This pest introduction may be prevented by the plant introducer if he will but have a thought. Inquiry coming to us as to bringing plants from the British West Indies, we wrote the State Horticultural Commissioner and the secretary, Mr. O. E. Bremner writes:

I will say in regard to the quarantine on seeds and plants that it at present includes only the states of Florida and Louisiana, and at the time it was made was supposed to include all the sections in the United States where the whitefly was known to exist. Since that time a new whitefly, the aleyrodes howardii, has come into prominence in the West India Islands. I have received specimens from Cuba and it is a much worse pest than A. citri.

In regard to the British West Indies, we know absolutely nothing, and have no way of finding out in regard to the insect pests and diseases. We do know, though, that there are many citrus pests existing in Tahiti and Cuba, besides the whitefly, and it is reasonable to suppose that the other islands of these groups contain these pests as well. With these facts before us, it is well to be very careful what we admit from these sections. For instance, we have as you know a boat plying between the Marquesas Islands and San Francisco every month, and although a few entomologists have visited the islands our knowledge is extremely meager.

We have taken very many detrimental insects, particularly to citrus culture, in quarantine, and never allow any plants or fruit to come ashore from these islands.

While I do not believe there would be a great deal of danger from the importation of seeds, particularly orange seed from this Island of Antigua, it would in my estimation be very poor policy to admit anything of the plant nature. Taking this view of the matter, we have always sought to discourage foreign importations, and particularly those from countries where the fauna is not known at all.

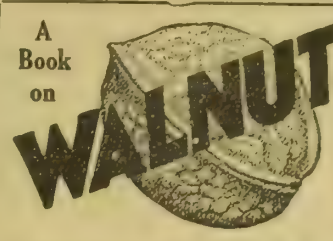
Technically speaking, the seeds and plants could be introduced, but for the good of the country and the fruit industry in California, we should discourage any such undertaking.

UP IN MERCED COUNTY.

The peach crop in the Atwater district of Merced County will net handsome returns to orchard owners this year. There is probably no district in the state where peaches bear as well year in and year out as in the sandy loam soil of Merced County. This year, when the crop in some other parts of the state has been reduced or completely spoiled by frost, Atwater orchards show a good yield. The soil in this district is especially adapted to peach growing. Trees bear in three years and several orchards,

(Continued on Page 727.)

A Book on WALNUTS And How to Grow Them



The only book ever written devoted exclusively to the walnut. Gives instructions for planting and propagating compiled from results of twenty years experience in walnut growing. The grafting process as depicted with photographs is applicable to all trees. Prepaid, $1.00.

First National Bank, Berkeley, Cal.

BUY THE LOWEST COST ENGINE MADE. Lowest fuel cost; lowest up-keep cost; easiest on the machine it operates, delivering steadier power than any other gasoline engine, adapting it especially for operating farm machinery, with better results and least waste of grain. Lowest fuel cost for it runs on Gasoline, Kerosene, Distillate, Gas or Alcohol and has perfect lubrication. Lowest cost because it delivers greatest available power per horse. A slow speed, high duty engine. Starts easier and quicker than any other engine, occupies less space, is less cumbersome, with less vibration, therefore adapting it for either stationary, portable or traction use. IT IS THE POWER CONTRACTOR'S FAVORITE ENGINE. No engine made has so wide a range of use. YOU WILL MAKE A MISTAKE IF YOU DO NOT WRITE US FOR INFORMATION. 1½ H. P. to 5½ H. P. single cylinder. 6 to 20 H. P. two cylinder. 30 to 50 H. P. four cylinder. State your requirements and get our advise.
THE TEMPLE PUMP CO., Manufacturers, care of David Rutherford, 1396 Harrison St., Oakland, Cal.

Those Pigs

will fatten faster and grow into dollars quicker on our Alfalfa Farms in the Sacramento Valley than they would in any of the Eastern States.

Here is what Mr. Spencer did:

Mr. Spencer, an Iowa farmer who had been baffled by Iowa weather and whose family needed a change of climate, bought 40 acres of this Sacramento Valley land, the same kind we are offering to those who wish to come with us. He put 18 acres of it into alfalfa and bought $300 worth of hogs. The second season he marketed $1,700 worth of hogs and had $1,500 worth left. He increased his alfalfa patch and raised $5,000 worth of hogs the third year on the farm.

Marketing hogs is a simple matter in the Sacramento Valley. They may be sold on the land or they may be driven to the bank of the Sacramento River and there loaded on barges to be floated to San Francisco. By this plan they arrive in fine condition. They sell at 6 to 8 cents a pound live weight. It is entirely feasible to pasture quite a number of hogs to the acre during the summer and still cut the alfalfa for hay.

With these possibilities you will realize that in acreage

"Twenty's Plenty—Forty's a Fortune"

Hog raising is one of the most profitable industries in the Sacramento Valley owing to the bountiful yield of alfalfa, the mild winters and the long growing season.

The markets are waiting for your products—your success depends on your efforts, with no limit to the results you may accomplish. If you'll work, you win. You can purchase one of these small farms on very liberal terms.

$15 DOWN THAT'S ALL **$11 A YEAR** THAT'S EASY

The Sacramento Valley Irrigation Company will sell you from 20 to 80 acres of their great project for $125 an acre, $15 down and the balance spread over 10 years. If you want to meet opportunity face to face, write today for full information.

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

BREEDING AND FEEDING THE DAIRY HEIFER.

Professor J. M. Truman, of the Connecticut Agricultural College, in an address before the Guernsey Club of Boston, made use of these words:

"In selecting breeding stock the law of ancestral heredity must be constantly kept in mind. Remember that the sire and dam, the grandsires and grandams exert a much more powerful influence over the offspring than do the more remote ancestors. The best information available assigns heredity values as follows: Fifty per cent of the characteristics of the offspring, or 50 per cent of the offspring of any one combination will, on the average, be like the immediate parents. This allows 25 per cent to each individual. The four grandparents are responsible for 25 per cent of the characteristics of the offspring, making each one of this generation responsible for 6¼ per cent.

With all due respect to Professor Truman for his really valuable address, we must confess that the above calculation appears more mathematical than actual or philosophical. No provision is made for two things: (1) The individual prepotency of either sire or dam and especially the sire. (2) The well known and peculiar transmission of feminine qualities through the sire, the old saying dating back to a period "whereof the memory of man runneth not to the contrary," that daughters do take from their father; sons from their mother. Every breeder of adequate observation sees these two forces of heredity constantly playing a controlling part in heredity.

We have had cows in our own herd whose prepotency was so strong that it always overcame the more desirable prepotency of the sire. Again, we have had cows who would not breed (nick) favorably with certain bulls but would do so readily with others. The calves in the first case would show an anaemic, lifeless character; in the latter case they would be strong and vigorous. In all these cases the power of hereditary transmission was greatly modified, so that the mathematical proportions of Professor Truman's formula did not apply.

Particularly does the theory not apply to the conditions mentioned under division two. The superior prepotency of the bull in the creation of feminine traits finds no definition or provision in Professor Truman's statement.

Farmers are counselled constantly to pay more attention to the selection of a bull than to that of cows, if it is cows they want to produce. We are convinced that this is correct. But if it is a bull they want then they should pay the greatest attention to the character of the mother. Therefore, if this theory be correct, we can readily see that the bull does not transmit his qualities in equal proportion to male and female offspring.

At the head of the Hoard's Dairyman herd is a bull that is double grandson of the famous Guernsey bull, Masher's Sequel. A son of Masher's Sequel (Galaxy's Sequel) was bred to a daughter of his sire, the cow, Lavinia, thus brother and sister were bred together. We reasoned that this combination would greatly increase the prepotency of our bull in the qualities for which Masher's Sequel was justly celebrated, and the quality of his get so far has justified our judgment, although none of his daughters have as yet come into motherhood. What we were after was to secure a greatly increased and controlling prepotency of the Masher's Sequel kind to nick with other very desirable lines of blood we had established. The formula would not stand in this case just 50 per cent of both sire and dam but by reason of increased potency due to his breeding we estimate the get of this bull will inherit nearly 75 per cent of the quality of his grandsire. So in other cases, while the offspring may have the blood elements of sire and dam in equal amounts, the super-potency of one or the other may determine the form, color and quality of the resulting offspring.

The wise breeder of cows always keps his eye on the sire. The wise breeder of bulls traces back for a long line of high producing mothers. This law of descent, whereby the motherhood quality passes down through the male line and masculine quality through the female line, is a very interesting one to study and creates very largely the wide range of variation that exists.—Hoard's Dairyman.

MILKING.

The way in which a cow is milked often has a great deal to do with keeping up the milk production for a definite length of time. If by thorough and proper milking a cow can be made to give more milk during the period of lactation than if the work is done less carefully it will certainly pay not to slight this part of the work. The extra milk secured will represent a clear profit aside from the little extra work involved, and a very small quantity of milk left in the udder at each milking will soon total up to a value of several dollars. So the milking should have the same important place as any other farm work.

At first sight milking appears to be a very simple matter, but the truth is that milking is a fine art. Many seem to think that almost anybody can milk, which is far from true, or at least it is not always advisable to have anybody and everybody do the milking. There is all the difference in the world in milkers. One who understands the work and enjoys it can, when in practice, milk a cow in far less time and do more thorough work than those who perform the work mechanically and with no object beyond getting it done. The difference in the amount of milk obtained from the same cow in the hands of different milkers has been noted by many. A milker who is gentle in his movements is pretty certain to get all the milk; while a milker whose movements are rough is quite likely to lessen materially the milk flow.

A frequent change of milkers is a mistake, even in instances where two or more members of a family do the milking and each person understands the work to about the same degree. A cow gets used to a certain milker and if a change is made she probably will not give down her milk so well nor can the new milker milk her so easily or thoroughly as the milker to whom the cow is accustomed.

A cow should always be milked in the same manner, at the same speed and at the same time of day. Changes in these matters will tend to irritate and excite her. When a cow becomes accustomed to being milked at a certain time of day, she knows when that time arrives and expects and wants to be milked then. If disappointed, she will probably give less and poorer milk than if milked at her regular milking period.—Successful Farming.

BIOLOGY OF TEXAS FEVER TICK.

In order that eradication of the cattle tick from the states below the quarantine line may be the more intelligently and successfully carried out it is necessary that it should be based upon the most accurate knowledge possible of the life history, habits, etc., of the tick.

With the view of supplying possibly useful additional data relative to the biology of the tick, the Zoological Division of the Bureau of Animal Industry and the veterinary department of the Alabama polytechnic institute have conducted a series of investigations upon the life history of the tick, its habits, and the manner in which it is affected by climatic and other environmental conditions; and this data has just been published by the Department as Bureau of Animal Industry Bulletin No. 130.

The work carried on during the past

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE LAWRENCE-WILLIAMS COMPANY, Cleveland, Ohio.

No Hoof-No Horse

Statistics show that 80 per cent of all horses are lame, and that 80 per cent of the lameness is caused by hard and contracted feet. Especially is the dry season in this section very hard on hoofs. As a hoof softener, toughener, nourisher and grower theer is nothing equal to

ESHELMAN'S WOOL FAT HOOF HEALER.

A horse's hoof is from 60 to 70 per cent water. Grease and water will not mix. There is no grease about Wool Fat. It mixes readily with water, is very penetrating, and while a great medicine of itself, it also acts as a vehicle to carry to the afflicted parts the other medicinal properties of the HEALER. It gives natural stimulation and nourishment to the hoof. There is nothing that can compare with it for this purpose, nor as a remedy for tender, brittle, hard and contracted hoofs, split hoofs, quarter cracks, mud fever, scratches, corns, cracked heels, grease heels, and for all kinds of sores and cuts anywhere on any stock. It will surprise you with its power as a healer and restorer. It is not a new remedy, but has been on the market in the East for many years, where it has given the greatest satisfaction.

4 oz. package, 25c; 12 oz., 50c; 32 oz., $1.00; 5 lb. pail, $2.00; 10 lb. pail, $3.50. It is easy of application. Send for Folder with many testimonials of big horsemen, vets and others. Or better accept our

TRIAL OFFER.

We will send you a 2 lb. can; use it 15 days, and if satisfactory send us $1.00. If not, write us to that effect, and you need pay nothing. We take all the risk; you just try it. Send for it today.

six years by the Bureau of Animal Industry in co-operation with the state authorities has shown that the eradication of the cattle tick from the infected states is entirely feasible, that its disastrous effect upon the cattle industry of the South can be prevented.

The usual host of this tick is the cow or ox, frequently, however, horses, mules, deer, and sometimes sheep serve as hosts, and must be considered in plans of eradication. Hence, experiments were made with ticks on some of these animals and also upon rabbits, cats, dogs, and man. But none of these, with the possible exception of deer are susceptible to tick fever, consequently they suffer from the tick as a simple parasite and not as a transmitter of disease.

Only a part of the development of the tick takes place on the host; the rest of the development occurs on the pasture occupied by the host. Therefore, studies were conducted both on the pasture, and the animals in the affected locality, and under conditions as nearly as possible like those in open fields, in laboratory investigations, tests, and experiments. These are described in detail, the results given, and conclusions stated.

As all information which would assist in removing the greatest barrier to live stock raising in the South, should prove of value to the future development and prosperity of the country now below the quarantine line, so also, is it of interest to the dealers and consumers of beef and beef-products in all parts of the country.

Veterinary

Bunch or Ulcer.

A horse, eight years old has a bunch on the inner surface of the hock joint. The place scabs over but the scab has come off from time to time during the past year and the bunch has grown out a little more each time.—Subscriber, Pasadena, Cal.

This, in all probability is a bursattee sore. When the scab falls off again dry the raw surface by applying absorbent cotton for a few moments, then rub a little powdered bichloride of mercury into the raw surface only, taking care not to allow the powder to come into contact with the healthy skin at the edge. After about four days a part of the bunch may be lifted out. Repeat till the middle is level or below a level with the surrounding skin. Then apply with the end of a feather just enough formaldehyde to wet the entire raw surface. —F. G. M.

Inflamed Udder.

A mare has an inflamed udder. Some time after the colt was weaned it nursed again and brought the mare to her milk, and a caked bag is the result. It swelled and broke in several places. Advise treatment.—Subscriber, Princeton.

Inject hydrogen peroxide diluted with a equal quantity of water which has been previously boiled and cooled. Dilute the amount required for one injection just before using. Treat the wounds once daily. A soft rubber infant rectal syringe with a hard rubber pipe is a cheap and efficient instrument for this purpose. Dissolve two ounces of potassium iodide in a half pint of water and give one tablespoonful of the solution in the feed twice daily.—F. G. M.

Lump Jaw.

A fine heifer has a large lump on her jaw which I am told is lump jaw. Kindly prescribe.—Subscriber, Calexico.

Lump jaw of cattle is caused by a fungus or mold growing in the flesh or bone. Have your druggist dissolve two ounces of potassium iodide in one pint of water and give the cow two ounces of this solution once daily in a pint of water as a drench. Skip five or six days and repeat the course. Also paint the lump with tincture of iodine three days in succession every week.—F. G. M.

Pigs Diseased.

During the past two years my young pigs when about two months old, have contracted a disease with the symptom of weakness in the back and after lingering a while, die. The disease never affects the old pigs. Thinking the trouble a disease of the breed, I sold all and bought a new lot. The pigs from the new sows are now about two months old and several of them are afflicted with the disease.—Subscriber, Modesto.

The fact that the disease has appeared among the first pigs of the purchased sows indicates an infection existing in the soil, and since the young pigs only are affected, the sows are immune from a previous attack or because of age—probably the former. Open the next pig which dies and remove the large intestine with a portion of the small intestine. Rip this gut open and wash the inner surface—if ulcers or round, brownish raised patches are present the disease is hog cholera. If this condition does not exist, examine the kidneys for worms. —F. G. M.

A REPENTANT HORSE TRADER.

A curious case was that of Robert Caple, whose death occurred not long ago at Clayville, near Utica. He was a successful horse dealer, and made a fortune at his trade. Then (about twenty years ago) we are told that he joined the Roman church and decided to give away all he possessed. But he did not do this at random. He began by reimbursing everybody of whom he thought that he had gotten the better in horse trades. He went from place to place seeking out the men with whom he had dealt. In Watertown he found one man whom he thought he had worsted to the extent of $175 in a single trade. There and in other places he paid men money who firmly believed that they got the better of him in their transactions—and perhaps they had. When he had paid back all that he could be conceivably accused of owing, he gave away the rest of his fortune to the poor. Families in Utica and all through the Sauquoit Valley were remembered in the distribution of goods and money, until Mr. Caple was reduced to poverty. Friends in Clayville built him a modest cabin, and here for the last fifteen years he lived, prayed and fasted, leaving his home each day to visit the sick, to carry food to the poor, and to beg his own meals and clothing.—Country Gentleman.

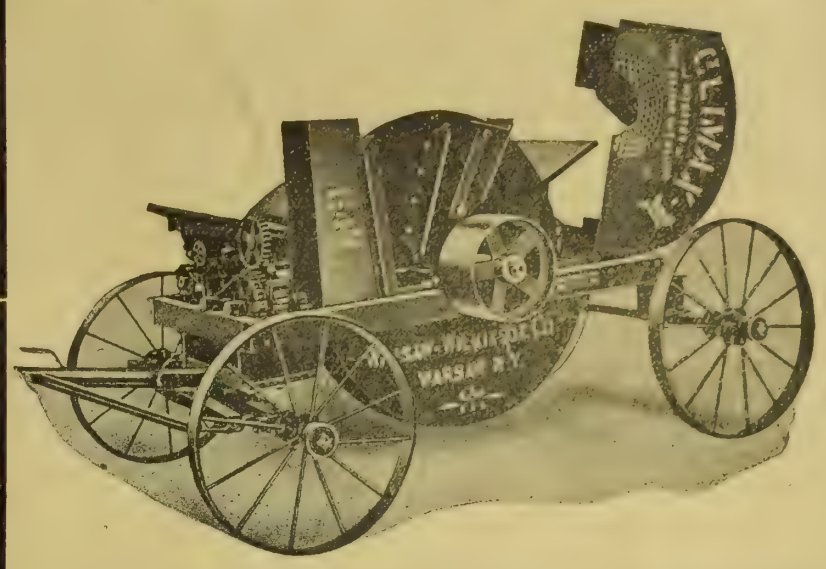
Climax Ensilage Cutters



In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequaled in simplicity, strength, durability, convenience and safety in operation, and the excellent quality and uniformity of the silage. We received at the

St. Louis Fair the Only Award

for ensilage cutter of the side-wheel type, 5 to 50 tons of green corn per hour, where cut in one-half lengths, other feed in proportion. For further particulars, call on or address

The Ornamental Garden

GOPHER PROOF PLANTS.

By Dr. F. Franceschi.

Many are the blessings bestowed upon this privileged land of California, and the longer one lives here, the better he can appreciate them. But a few troubles there are also, and, from the gardening standpoint, gophers are certainly the worst, and it is a meager consolation for us to know that we have them in common with less favored states.

In city gardens, generally of moderate size, and wherever human habitations and cats are thick enough, gophers will not give much trouble, and their appearance in a "yard" will be detected before they have made irreparable damages. Not so in the outskirts of towns, or in the open country, where the grounds devoted to gardening are generally extensive, and where the greatest vigilance is often fruitless, for the reason that gophers, never seen above the ground during the daytime, are known to travel considerable distances during the night, and to burrow again in any fresh place that appeals to them. In such large places, poison, traps and cats are certainly to be recommended, but may prove insufficient in many cases, and it is obvious to look for more radical remedies. Since I started planting at our place at Montarioso, seven years ago, I have gained much experience concerning gophers and their behavior with different plants, and I think that a condensed summary of my own observations may prove of practical use to many readers of the Cultivator.

Montarioso comprises the highest point of the Mission "Ridge" (825 feet elevation), and although within the Santa Barbara city limits, is entirely surrounded by pastures or by chaparral, the nearest houses on the south being half a mile away, while north, west and east there are no houses for many miles. In such conditions the native fauna is most interesting, and we have trapped here everything, except bears and mountain lions. Ground squirrels and gophers were swarming on the place at first; their number was considerably reduced, mainly of the first named, but I soon perceived the impossibility of getting entirely rid of them, on account of their nocturnal incursions, and brought my attention to study what plants, if any, were really immune from the attacks of gophers. At the beginning I had planted a very large number of bulbs, and I believe they were the daintiest morsels for gophers and squirrels, as in a short time many species had entirely disappeared, but I discovered also that a few had not been touched, and their list has been increasing during these seven years. It includes now many genera of amaryllidaceae, which have a true "bulb," namely, Amaryllis belladona, the "belladona lily"; all species of hippeastrum, "scarlet lilies," Chlidanthus fragrans; all species of crinum, clivia nobilis, all species of hymenocallis, "spider lilies," and of pancratium, "sea lilies," Sprekelia formosissima, "Jacobean lily"; Sternbergia lutea, and all species of zephyranthes, "fairy lilies." Narcissus orientalis, "Chinese sacred lily," is eminently immune, while other more valuable species or varieties of narcissus are not. All species of amaryllidaceae, with no true bulb, and more or less fleshy roots, like agave, fourcroya, beschorneria, are instead very particularly relished by gophers.

Among the nearly related liliaceae, all species of aloes are immune; also agapanthus, "lily of the Nile"; all species of tritoma or kniphofia "red poker plants"; all species of scilla, the native "amole" or "soap root," Chlorogalum pomeridianum, while all true lilies and all species of yucca and dracaena are greedily devoured.

Alpinia nutans and all species of hedychium, "ginger plants," are immune. Among the extensive order of iridaceae, antholyza, aristea, herbertia, libertia, montbretia are certainly immune, and probably also some species of iris.

In comparison I have found a much smaller number of immunes among dicotyledonous plants. Still, we have the order apocynaceae, which comprises a great number of beautiful flowering shrubs or climbers, like nerium, "oleander," allamanda, carissa, cryptolepis, mandevilla, thevetia, and vinca, all of them immune. Also the immense and multiform order of euphorbiaceae, "spurge family," among which I will mention all species of euphorbia, poinsettia included, ricinus, "castor oil plant," aleurites, stillingia, and probably others.

It appears that the bulbs or roots of all above enumerated plants contain some acrid or poisonous juice disliked by gophers and other rodents, which leave them alone. This offers the suggestion that some particularly valuable plant may be efficiently protected by "ringing" it with a double or triple row of immune bulbs, which will also be very ornamental when coming in bloom at their season. I shall be particularly glad to hear from anybody of any addition to the above list of "gopher proof plants."

SHRUBS.

Before setting out perennials, their habit ought to be thoroughly understood. By habit, I mean the size to which they grow, their season of flowering, and whatever peculiarities may be theirs, for plants have their peculiarities the same as persons. If we know the height of a plant at maturity, we can tell how much space it requires to display its attractiveness to advantage, and whether it belongs in the background or in the front row. And if we know their flowering periods we can so distribute them that there will be flowers somewhere in the collection throughout the greater part of the season. If we do not familiarize ourselves with the habits of the plants we set out we are pretty sure to make serious mistakes in their location, and this we cannot afford to do because of their permanent character. Be sure where a plant belongs before you put it into the ground. The catalogues of the florists are so explicit about these matters nowadays that the amateur gardener can learn all that it is necessary to know about the plants she makes use of by studying them carefully.

Here naturally comes up the question of how to plant them—singly or in groups? If the grounds are limited, and a considerable variety is desired, of course single specimens will have to be depended on to a great extent, but where there is plenty of room, I would always advise grouping them, because a mass is much more effective when in full bloom than the single plant can ever be.

The question where to plant them will come up for consideration. I would keep them to the sides of the lot, or the rear of the house. Never scatter them over the lawn. If you have a row of shrubs along the boundaries of the home grounds, work your perennials in among them. This can be done with charming effect. I consider a combination of shrubs and hardy plants much more pleasing than a planting in which each kind is kept by itself. The illustration shows what fine effects are secured by making use of shrubs as a background for the perennials. But no two grounds are alike, and the woman who sets out to make a collection of these plants will have to decide the question of location for herself in most instances.—Country Gentleman.

THE LATEST AS TO PARCELS POST.

By Edward Berwick, President Postal Progress League of California.

There are always "things doing" in the matter of up-to-date universal parcels post. Unfortunately, it is not the United States that is doing them. We take a back seat and mumble out excuses for not doing things on account of our long distances. From England to Abyssinia is no mean journey, yet the British postoffice has recently announced an Abyssinian rate of 4s. 6d. ($1.08) for eleven pounds, while the United States postoffice still charges $1.76 for eleven pounds in three parcels, from New York to Brooklyn.

At the same time the American express companies carry for the British postoffice all parcels up to eleven pounds in weight from New York to any point in the United States at a flat rate of 24 cents each. American citizens are charged $2.35 on an eleven-pound package from Pacific Grove to New York by express, and cannot send an eleven-pound package at all by merchandise mail. It would have to be made into three parcels, and these would be charged $1.76.

Great Britain sends eleven pounds two thousand miles to Indo-China for 72 cents, and we pay 64 cents for four pounds from San Francisco to Oakland, less than ten miles.

Canada has a list of far-away lands with which her merchants can keep in touch by means of a low-priced parcels post, that enumerates some 240 countries. Her postoffice shows an annual profit of $800,000.

New Zealand has a similar list, covering about seventy pages (including rules and regulations) in the New Zealand Postal and Telegraph Guide for 1911.

The United States Postal Guide enumerates only about forty of these distant places as on our parcels post list. To about all of these, save France, our citizens can forward eleven-pound packages at the rate of 12 cents a pound, or 4 cents a pound less than it costs to the nearest village!

Why is this? Because foreign rates are made by the President and Postmaster General, while the making of domestic rates is in the hands of Congress, and Congress is largely influenced by other interests than the interests of the people. Is it not time the people more vigorously instructed representatives and senators as to their wishes?

SUGAR BEETS AND SUGAR BEET CULTURE.

The above is the title of a little book of seventy-six pages, which wastes no space in unduly wide margins, neither in blank leaves, containing the history of the sugar beet and beet sugar. It refers to the fact that less than two decades ago there was practically no beet sugar industry in the United States; less than twelve years ago there were no factories in Michigan; prior to 1899 there was not a single sugar mill in Colorado; the first factory in the United States was established at Alvarado, California, in 1870, later reorganized and now owned by the Alameda Sugar Company and still in operation. Many interesting facts on the industry are given, and much of a cultural nature is also added. The question "Do sugar beets exhaust the soil?" is discussed in a few pages, and their yield and analysis are given to show that it is not much harder on soil than many other crops. In fact, it is usually considered one of the most exhausting plants as to potash, and yet, compared to tobacco, the sugar beet takes but 70 pounds of potash, while tobacco requires 200, and even clover hay takes 88 pounds, while barley requires 57. The question as to whether the sugar beet has reached its limit also is given considerable attention. An extensive discussion of the by-products is given in an appendix. In this the tops, the pulp, molasses, lime cake and other waste materials are treated. It is published by the Beet Sugar Gazette Company of Chicago.

PAINTS AND PAINTING.

Of the various classes of paints—as tar, varnish or resin, and oil paints—the last are the most extensively used, and in the majority of cases afford the best protection.

The wearing quality of a paint, and its protecting power, are due more to the pigment than to the oil. With a pigment ground in oil, the finer the pigment, the longer it will wear; but it will dry more slowly. A layer of paint is about three times as thick as a layer of linseed oil; hence, for this and other reasons, a paint affords better protection than oil.

Paint should be applied only to a clean and dry surface. Moisture under a paint causes it to blister when exposed to the sun; also, moisture between coats has the same effect. On old painted surfaces, the paint should be removed or rubbed down smooth before applying new paint. In some cases a careful removal of blisters is sufficient, but the surface should be free from dust and dirt. In case of the removal of paint by a solution of caustic alkali, the surface must be thoroughly washed to remove traces of alkali, and carefully dried before painting.

Iron or steel surfaces should be carefully cleaned, by means of a steel wire brush and emery paper, to insure the removal of all rust before painting.

Paint generally should be applied with a good round brush, and well rubbed out. The rubbing out serves to remove any bubbles of air, also the film of air found on all surfaces; and it insures a thorough incorporation of the paint with the surface, thus affording better protection. The rusting of farm machinery is no doubt largely due to the fact that it is "painted" by the dipping process. Air bubbles cause openings in the paint film, moisture enters and rusting begins; also, the paint not being cemented to the surface by being well brushed out, is easily removed mechanically.

In the case of ready-mixed paints, it is generally found that the pigment has largely settled to the bottom of the can. In preparing the paint for use, the liquid portion—oil and dryer—is poured off into a clean can; the pigment and the small amount of the oil remaining in the bottom are thoroughly worked up and mixed, by means of a strong, short stick. When the pigment is thoroughly loosened from bottom and sides of the can, the fluid portion removed is added from time to time, until the paint is uniformly mixed. Paint should be kept in cans having air-tight covers. After using, brushes should be cleaned with benzine or turpentine, and should not be left in the paint.—G. W. Walker, Minnesota University Farm.

Mills for the manufacture of alfalfa foods have been and are being established, and it is reasonable to assume that the use of these foods will become quite general in cities and districts remote from the alfalfa regions. Whether or not the actual feeding value is appreciably increased, or the nutritive constituents made more thoroughly available, is as yet not determined by sufficient tests, nor has it been determined by any station test that any factory food preparation is more economical than alfalfa hay, where the hay can be obtained well cured and with a reasonable proportion of its leaves. It is altogether probable, however, that alfalfa meal will be more economical in distant cities than baled hay. If these preparations of alfalfa prove to be satisfactory to consumers in distant markets, it will lead to the multiplication of mills in the alfalfa regions, thereby decreasing the cost of transportation and giving the grower a wider and probably a better market. The use of the meal or the food preparations is likely to prove most especially valuable for dairy cows and poultry.—From Coburn's "The Book of Alfalfa."

Dwarf Milo Maize and Red Kaffir Corn

The two great drought resisters should now be sown. There is no more profitable dry land crop than these two members of the sorghum family. We have taken particular care in selecting acclimated seed stock of the true dwarf varieties, yielding two to three tons per acre. Write for samples and cultural directions.

Pacific Egg Food

Makes hens lay; none better.
Good for molting time, too.

Special prices: 90 lb. sack, $1.75; 75 lb. sack, $1.50; ton, $37.50

Seed catalog "G;" Poultry supplies "H;" Which shall we send you?

WEST COAST SEED HOUSE

111, 113, 115 WINSTON ST. between 4th and 5th near Main. LOS ANGELES

DWARF KAFFIR CORN for DRY LAND

No better fodder and grain crop can be planted on dry or alkali and than this prolific member of the Sorghum family. This dwarf variety possesses the advantages of more foliage, smaller stalk and ease of harvesting. Its great root system enables it to produce wonderfully in drought sections, and breaks up new ground for other crops.

FOR STOCK FEEDING

Dwarf Kaffir Corn will produce 10 to 15 tons of green fodder or silage to the acre, or 5 to 8 tons of dry fodder.

FOR POULTRY

The grain is a valuable food for poultry and will crop 2,000 pounds and upward per acre.

Write for cultural directions and price.

CONTENTS THIS WEEK

STATE POLYTECHNIC SCHOOL, Cover.
IS THE HORTICULTURAL LAW CONSTITUTIONAL, 707.
CITRUS AND TROPICAL FRUITS.—Citrus Culls as Fertilizer; Increasing Use of Fertilizers; Another Beneficial Insect; 708, 709.
DECIDUOUS FRUITS.—Pacific Coast Nurserymen's Association; Precooling of Fruit; Importing Plants from Infested Countries; 710, 711.
LIVE STOCK AND DAIRY.—Breeding and Feeding the Dairy Heifer; Milking; Biology of Texas Fever Tick; Repentant Horse Trader; 712, 713.
VETERINARY.—Bunch or Ulcer; Inflamed Udder; Pigs Diseased; 713.
ORNAMENTAL GARDEN.—Gopher Proof Plants; Shrubs; 714.
GENERAL AGRICULTURE.—Parcels Post; Sugar Beets; Paints and Painting; 715.
EDITORIAL.—Poor Kids; Cotton; Novel Experiment Station; Grasp the Opportunity; Cereal Investigations; 716.
AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast; 717.
PROFIT IN THE POULTRY YARD.—Pacific Coast Must Produce More; Sex of Eggs; Decomposition in Drawn and Undrawn Market Poultry; 718, 719.
QUESTIONS AND ANSWERS.—Capacity of Barrel; Centrifugal Lift; Boring Beetles; Fertilizer for Orange Tree; Draining Heavy Land; Bowel Trouble of Little Chicks; Lizard Trap; 721.
IRRIGATION AND FORESTRY.—Growing Automobiles by Irrigation; 722
HOUSEHOLD DEPARTMENT.—Such as I Have; How the Question was Settled; Paper Plaster and How to Use It; 724, 725.
PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 726, 727.

The next annual meeting of the American Association of Farmers Institute Workers will be held at Columbus, Ohio, November 13-5. At the same time there will be a meeting of the Association of American Agricultural Clubs and Experiment Stations. Farmers institute workers the country over will gather for instruction at this meeting.

POOR KIDS.

We trust the coming Fourth of July will be one in which sanity shall obtain. There has been such a demand for a sane Fourth for the past few years that there should be little difficulty in depriving Young America of what he has always considerd necessary to a Glorious Fourth. We must confess to a little feeling of pity for the youngsters. We have in hand from an Eastern magazine a suggested program for the day. It begins at 7 o'clock in the morning with "cannon balls," which, it is carefully explained, are oranges stacked on the table with a tiny flag in each. At 9 there is a "call to knapsacks," which prove to be boxes of "Gee whiz" popcorn. This we presume has already been carefully popped to remove all danger of injury. At 10 "bullets" are issued. These are nice little marbles. At 11 the youngsters are called into the house for writing notes home. Each is given a small box of notepaper and requested to write a note to Grandma. At 12 there is a call to "mess," dinner served on the lawn. At 2 "new uniforms" are issued. This is dress parade, fresh dresses and suits and a nice walk with Father. At 3:30 comes "canteen and hardtack," which is lemonade and Holland rusks. At 7 comes "picket duty," another walk, with ice cream at the end. At 9 "blankets and lights out."

We admit there have been practices permitted under the name of Fourth of July which were almost criminal and which have caused awful suffering. These should not be tolerated. But we hope the reaction will not go to the extreme of a mush and milk celebration which will only disgust the youngsters. There is opportunity for sanity on both sides of the question.

COTTON.

The area of cotton this year in the United States is greater than last year. To be exact, taking the figures from the last circular of the crop reporting board, it is 104.7 per cent of last year's area, or expressed in acreage, 35,004,000. The condition of the crop on May 25th was 87.8 of normal, as compared with 82 per cent in 1910 and 80.9, average for the past ten years. Texas is by long odds the biggest cotton state, having this year 10,868,000 acres planted. Georgia comes second with over 5,000,000. California is at the bottom of the list of 14 cotton producing states with her little 12,000 acres. However, watch California grow. We say this with confidence because in the columns given over to "Percentage compared with 1910" we stand 123. The state which makes the next best showing of increase in acreage is Oklahoma with 116, but the most of the cotton growing states show from 103 to 105.

Another feature in California's favor is that she shows the highest percentage in condition of crop. This is 95 per cent of normal while most of the other states run in the neighborhood of 83 per cent. This is the percentage of the greatest producer, Texas. Some others run as low as 76 per cent.

NOVEL EXPERIMENT STATION.

Of all the sugar factories in this state only one is maintaining an agricultural experiment station; this is the one at Spreckels in Monterey County. We may say in passing that this sugar factory is the largest handling sugar beets in the world. The management, recognizing the need of more intelligent planning and care in the raising of this crop, some years ago secured from the State University a young man who began experiments and gave suggestions to the growers. Later Mr. R. L. Adams took the work in charge and for several years he has been making practical experiments in the culture of sugar beets. These laws led to the determination of valuable factors which have aided the beet growers of the Pajaro and Salinas Valleys. A story of a little of this work and of a unique beet growers institute will be a feature of next week's Cultivator.

GRASP THE OPPORTUNITY.

Editor Matthews of the Covina Argus waxes wise on graduation day and inspired by seeing the youngsters taking their start in life in his community, which is largely a citrus growing section, gives the following advice:

"The ranch is worth considering, boys. When you get through with studies at the Covina high school, some of you go on farther to the colleges and state university, which is a high and laudable ambition. Some of you will turn your eyes at once to business. Perhaps you will look everywhere without seeing the opportunity that lies directly in this immediate vicinity.

"The orange grower must be an intelligent man, far above the ordinary tiller of the soil, or he will fail. Intelligent men from the East are coming in here every day, and their alert, trained minds grasp the opportunity. They see what is needed to make the orange business a successful business. It has taken long years of careful study on the part of the California rancher to arrive at a point where he understands the fundamentals of orange growing. It stands to reason that the Easterner is not going to grasp it in a year, or two years.

"Then, the man who is going to succeed, the man who has the best opportunity to succeed in this high class of farming, is the one who has lived amid oranges, heard orange talk all his life, and has worked and participated in the orange business. There isn't any better chance in the state for the young man graduating from high school than that of getting busy at once in the business of growing oranges in the Covina valley. The parents who are in a position to start the young man in business will not make a mistake if they start him right here in the Covina valley, where he will already have his life experience in the raising of citrus fruits.

"A boy's inclinations, his desires, his aims and ambitions may lead him to other paths. If he is absolutely determined to go elsewhere for his livelihood, it is his own affair. But to the ones who have made no decision, there is this suggestion to offer—become a scientific tiller of the soil; there is wealth, honor and reputation in it. 'Back to the farm' is a cry that is growing in volume, and those who do go back are going armed with education, intelligence, and a desire to make farming a business, and furthermore, a paying business. Stay in Covina, and grasp the opportunity that looks so good to so many people that they come three thousand miles to take advantage of it."

CEREAL INVESTIGATIONS.

The $15,000 appropriation made by the recent state legisalture has been referred to by several papers as a desirable departure from former methods, but this is merely a continuance of what has been doing for several years along agronomy lines under the direction of G. W. Shaw of the State University. Prof. Shaw has developed some remarkably promising results in wheat production, likewise barley and alfalfa. These investigations may lead to greatly increased acreage of the crops investigated. The state especially needs improved wheats, and some which Prof. Shaw has already distributed to farmers promise practically a doubling of the state's output.

One example of the advantages of parcels post is given on another page in the communication of Mr. Carnes of the State Insectary. He is receiving from Africa through international parcels post packages containing a new beneficial insect. As noted by Mr. Carnes, these are being bred out and will later be distributed to the orange growers of the state whose trees are infested with black scale. And here comes in the anomaly; it will cost more per pound to send these insects to the nearest postoffice to Sacramento, where the insectary is located, than it did to ship them from South Africa. Inconsistent, even funny!

On the first page of this issue may be seen a statement by State Horticultural Commissioner J. W. Jeffrey in which he maintains that the law under which the present county horticultural commissions are acting is sufficiently strong and has been upheld by successful operation for many years. The law must be sustained, or, as Mr. Jeffrey says, wiped off, and one which can be put in its place. California's productive interests are too important to allow an ineffective or inoperative law to endanger them.

The committee appointed by the recent citrus growers convention at San Bernardino to look into developing a standard for pedigreed nursery stock recently met at Riverside and discussed the question. No report is yet made. The committee consists of Mr. A. D. Shammel of the Bureau of Plant Industry; Carroll B. Smith of Redlands, J. H. Norton and Fred M. Reed of Riverside, and Mr. Vail of Santa Paula.

Charges have been filed and an attack is being made upon Willis L. Moore, Chief of the Weather Bureau. It is being pressed by Mr. James Berry, former Chief of Division, who tendered his resignation nearly a year ago.

The Secretary of State of California reports 1836 new registrations of motor vehicles during one month. The automobile is increasing in popularity every day.

Great plans are being made for the convention of the Pacific Coast Nurserymens Association which will open in San Jose next Wednesday morning. A special train is being made up from Portland, and nurserymen of this state, as well as many orchardists, will be in the Santa Clara Valley city to welcome the northern members on their arrival. Headquarters will be at the St. James Hotel.

It is estimated that the National Educational Association which will hold its 49th annual convention in San Francisco beginning July 8th, will bring to the state over 50,000 visitors. It is reported that over 400 "car parties" have been formed. In honor of the first woman president of the association, Mrs. Young of Chicago, the reception committee has been formed in San Francisco entirely of lady members.

The Northern Pacific railway is in line to encourage apple growers of the Northwest in its offer of $500 in gold for the best exhibit made at the American Land and Irrigation Exposition to be held at Madison Square Gardens, New York, next November. This should inspire Washington and Oregon apple growers to produce some fine fruit this season.

Agricultural News Notes of the Pacific Coast

Northern California

An alfalfa meal mill is assured at Biggs Junction.

Oroville's big Water Carnival is to be pulled off next week, the 16th and 17th.

The grain crop at Perkins, Sacramento County, gives prospect of a fine harvest.

Ranchers at Willows, Glenn County, are going in for alfalfa, blooded cattle and fine hogs.

With some cars of cherries selling well up towards $6000 cherry people are highly elated.

Market fishermen along the Sacramento River near Chico are making big hauls of salmon.

Placerville, Eldorado County, says that the Bartlett pear crop now promises to be the best ever.

Shipment of a thousand bales of hops has just been made from Wheatland, Yuba County, to London, Eng.

The Sebastopol Berry Growers have secured the establishment of an early morning berry train from that city.

Fruit buyers in Alameda County are offering $60 a ton for apricots with a few contracts for choice fruit at $65.

The Cannery picnic at Gridley, Butte County, was attended by over 8000 people and everybody had a good time.

The Sebastopol reorganized Grange is working to bring the next state Grange meeting to that thriving little city.

The Fruit Growers Association at Lincoln, Placer County, will ship this year through the Newcastle Association.

The Ukiah Farmers Club has secured an offer from the Winery Association of $15 a ton for a period of five years.

Poultrymen of Ukiah, Mendocino County, have organized and will affiliate with the Santa Rosa Poultry Association.

The pear crop in portions of the Sacramento Valley is reported practically destroyed by thrips. The loss will be about 400 cars.

From present indications the grape crop in the Sacramento Valley will be greater than any previous year and satisfactory prices are promised.

Winters, Yolo County, is sending out daily shipments of apricots. On account of the cold weather no carload shipments have yet gone forward.

Large acreage of river bottom lands just south of Marysville, Yuba County, is being cleared preparatory to the commencing of gardening on a large scale.

The state board of prison directors has fixed upon six cents as the price of jute bags; this is a low price and made possible because of purchases made when raw material was much cheaper than at present.

Members of the Live Oak, Sutter County, Almond Growers Association are planning to put up a new warehouse next season to take care of the big crop raised in Live Oak and Pennington sections.

The country about Yuba City, Sutter County, is seeing some lively bidding for peaches these days. Phillips and Tuscans have been contracted in small lots for $40. The larger growers are holding off for $50.

Central California

Many grain and grass fires are reported over the San Joaquin Valley.

Santa Clara Valley estimates the apricot output at about 50 per cent of normal.

Harvesters have started operations in Lakeside and Corcoran sections of Kings County.

Delano, Kern County, is showing a good grain crop this year and good sales are being made.

Merced capitalists are interesting themselves in the possibilities of rice growing in their county.

Some Kings county growers estimate the coming apricot crop at about 40 per cent of normal.

A Porterville man has produced a seedless blackberry that is said to be a remarkably large and juicy fruit.

The Pacific Coast Trotting Horse Breeders Association will hold a big meet at Salinas the week of July 30.

Mt. Campbell orange growers are expecting an unusually large crop of fruit. Many new orchards have been set out this year.

The big cannery at Selma, Fresno County, is installing machinery and will be ready to take care of the peach crop this season.

Last fall the shipments of cattle from the district around Porterville exceeded in value the oranges sent out by about $50,000.

The Santa Clara County prune crop this year is estimated by the Farmers Union to be between 73,000,000 and 76,000,000 pounds dry.

The supervisors of Tulare County have agreed to appropriate $10,000 to be devoted to a campaign against tuberculosis in cattle and hogs.

Exeter, Tulare County, reports shipment last week of 50,000 young tobacco plants to Dinuba and fully as many more to other nearby sections.

Hanford business men are considering ways and means of preparation for the Kings County Fair, date for which has been set September 25-28.

About 60,000 bags of grain will be this year's output from Ducor, Tulare County. Buying is already begun and the first delivery of crops will start this week.

The million dollar plant of the Pacific Sugar Company at Corcoran has been purchased by Los Angeles capitalists and it is expected that it will be in operation next year.

There has been noticeable activity of late in fig planting in Merced and Stanislaus Counties. Some three thousand young trees have been planted in the last three months, mostly Calimyrnas, White Adriatics and Blacks.

The Morgan Hill, Santa Clara County, Farmers Union has filed articles of incorporation. The directors for the first year are: Zard Bagwill, E. A. Brizee, George R. Lynch, Thomas W. Baird and J. H. Harkness, all of Morgan Hill.

Col. Hersey of San Jose estimates that Santa Clara County will show this year over 250,000,000 pounds of green prunes. He also says that 10,000 pickers will be required to harvest the crop and with teamsters and other laborers employed, over 25,000 men will be required.

Southern California

Bee men of San Bernardino County are all smiles over the prospect of a bumper crop of honey.

The first ripe grapes are being shipped out of El Centro, Imperial County. The variety is Persian 23.

Valley Vista, Riverside County, bee men claim that the spraying of fruit trees causes the death of many of their bees.

"Lima Bean Day" is the latest. A mass meeting of Ventura County growers will be called to consider boosting the proposition.

Growers of Ventura County estimate this year's lima bean planting will cover 30,000 acres. 16,000 acres will be put into sugar beets.

The total shipments of lima beans from Oxnard, Ventura County, amount to over 10,000,000 pounds for the first four months of this year.

The American Beet Sugar Company will start its Oxnard plant late in July. The acreage of beets will be somewhat smaller than last year.

The Palo Verde Cotton Growers Association has just received its charter of incorporation. The cotton crop is making very satisfactory progress.

The plant of the Pacific Packers Supply at Redlands was burned last week for the third time. The fire is supposed to be of incendiary origin.

Shipments of lima beans are being made from Coachella, Riverside County, the first time they have been raised on a large commercial scale there.

The latest Packing Company to be organized in the Redlands district is the Gold Banner Association. It will be a mutual concern and 600 cars have already been signed for the new house.

An interesting experiment is being made in tree surgery by the Park Commissioners at Riverside. The diseased portions of large pepper trees have been cut away and the cavities filled in with cement.

The Hemet Bee Keepers at a recent meeting selected the following directors to have entire control of the output of the members: Chas. Sims, J. A. St. Johns, W. H. Densmore, W. B. Tripp and C. J. Davidson.

The Citrus Standardization Committee recently appointed by the State Horticultural Commission will probably call a mass meeting soon of all growers in the orange belt to discuss best plans for eliminating defective fruit.

The first co-operative marketing association of Etiwanda, San Bernardino County, is the Etiwanda Grape Growers Association which will deal almost exclusively with the marketing of green grapes, mostly table grapes shipped to the Eastern markets.

The Hemet Deciduous Fruit Growers Association at its last meeting decided to sell its fruit green. Three hundred tons of apricots have already been contracted at $40 a ton. The fruit will be about a month late in ripening.

Cattle raisers are in arms over Senate Bill 541 which prohibits the importation of neat cattle for dairy or breeding purposes except accompanied by veterinarian's certificate that they have been examined and subjected to tuberculin test.

The Coast

The timber industry of the Inland Empire brings yearly wages aggregating $14,000,000.

Irrigation by whirling sprinklers is to be carried out on an extensive scale in Grant County, Washington.

Farmers in Cascade County, Montana, are delighted with prospects of the biggest apple crop ever.

Pullman, Washington, is receiving large shipments of cherries and strawberries from the Snake River section.

Nearly 500 head of horses have been shipped from Pendleton, Oregon, the last week, most of them going to Canada.

Although the season has been very backward, growers of Hermiston, Oregon, are now sending out shipments of strawberries.

At Angeline, Washington, the cool weather has prevented rapid growth of grain but it is rooting deeply and promises big crop.

North Powder, Oregon, has been chosen as a site for a big new packing plant to handle live-stock. It will employ 1500 people.

During the last week of May 2,975,000 pounds of this season's wool clip was sold by Montana sheep men at an average figure just under 18c.

The spring wheat yield in Baker County, Oregon, will be a bumper one. There are 7500 acres planted this year, trebling the acreage of a year ago.

Yuma cotton raisers are pleased over the development of a valuable strain of Egyptian cotton, having very large bolls of superior length and quality.

The first cutting of alfalfa on the Umatilla project in Oregon began the 1st of June and promises to be the best since the project was opened in 1908.

Ranchers around Davenport, Washington, have started in thinning their heavily loaded peach trees to keep limbs from breaking before the crop is ripe.

The Arizona ranges are pretty well cleaned up and only heifers are left. Over a half million dollars are in the banks to the credit of the various stock men.

Students from the State College of Agriculture at Coleman, Wash., will go into the Snake River orchards to help in harvesting the fruit as soon as school closes.

Fruit growers of Polk County, Oregon, will hold an apple show during the early part of November. Cash prizes will be awarded for twenty varieties of apples.

After this year the landowners in the Klamath Reclamation project who are not receiving water will not have to pay any of the expense of maintaining the Water Users Association.

Sheep men at Baker, Oregon, are appealing for lower assessment of sheep, maintaining that while they can sell flocks at but little over two dollars a head they are assessed six dollars.

The first public wool sale at Pendleton, Oregon, late in May resulted in the transfer of $50,000 pounds which is said to be the smallest sale ever made in that city; prices ranged from 10⅛ to 14⅛.

Have you seen the Norwich Automatic Feeder and Exerciser?

Thousands have and are using them.

Agricultural Colleges endorse them. **WHY?**

Because you save 50% in labor, 25% in your feed bill and your egg production is increased 18%. Think of it. We guarantee all these claims. It costs you nothing to prove them. Send for printed matter.

OAKLAND POULTRY YARDS

149 G California St. San Francisco, Cal.

Breeders for 40 years Standard bred Fowls.

Send for circulars.

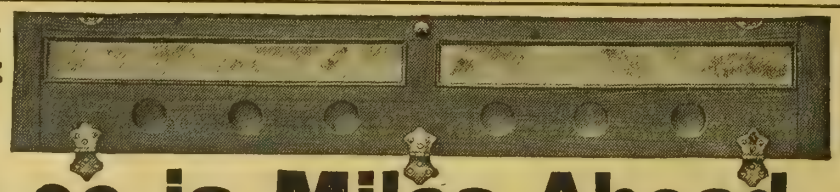
This open front door makes perfect ventilation



Mandy Lee is Miles Ahead

It is the only Incubator without a "Sealed," Air-tight Egg Chamber. It supplies the life-giving oxygen freely, draws off the carbonic acid gas, and is saving the lives of millions of chicks.

READ the story of the Mandy Lee triumph in our new catalog. Other incubators are already preparing to imitate and profit by our great discovery.

No guessing with a Mandy Lee

You cannot afford to buy an old-theory incubator which may go out of date and be discarded next year. You should know the truth *now* about the great discovery. The book is free. Ask for it.

There IS Something New in Incubators

We have taken the boldest and most important step ever taken in incubator building. See the openings into the egg chamber? They mean the saving of chicks' lives. It is the key to *right* hatching. Ventilation in the Mandy Lee is now perfect. It goes on all the time, neither above nor below, but right *at the eggs*. Every minute of the hatch the life-giving oxygen is freely passing in to the eggs and the carbonic-acid gas is passing out. And correct ventilation is just one of the great Mandy Lee features.

We Don't Guess—We Measure

The Mandy Lee is as far in advance of other incubators in heat and moisture as it is in ventilation. We do not guess at anything. The sensitive regulator controls heat to the fraction of a degree and *we measure moisture* just as accurately with the Mandy Lee Hygrometer (one sent with every incubator). You know what you are doing. *You* measure and control moisture; *you* control the hatch. The Mandy Lee is the all-season, all climate, all condition hatcher, always producing the most and the strongest chicks.

Mandy Lee Brooders give direct contact heat to the backs of the chicks. That is *real* mothering, the most important thing in poultry. Hovers are raised and lowered as weather gets warmer or cooler—heated from end to end. Chicks do not pile up and smother. Write to-day for catalog and full information.

NEW OUTDOOR BROODER
Heated—Storm-proof

GEO. H. LEE CO., LOS ANGELES, CALIF.

225 West Second St.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will convey a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

PACIFIC COAST MUST PRODUCE MORE.

By H. L. Whiting, Walla Walla.

So much attention has been paid to the fruit industry and wheat raising in the Northwest that many things have been overlooked, and first among the missing can possibly be numbered the poultry industry. Had it not been for an enterprising Commercial Club secretary in one of the larger coast cities, possibly the present startling conditions would not have come to light for some time. The city in question, it was found, imported 2,000,000 dozen eggs during the year 1910, most of these coming from the Chicago markets, while dressed poultry shipped in amounted up into the hundreds of thousands of dollars. This led to a general inquiry, and now that the dust of research has finally cleared it is found that, in all, 15,000,000 dozens were shipped to the Northwest from east of the Rocky Mountains. Where conditions are so ideal for the raising of chickens, and where everything else is so plentiful, such conditions hardly seem possible, but the estimates are conservative, and the facts of the case are that were it not for the Eastern poultryman the rich and prosperous Northwest would go hungry for hen fruit and only the well-to-do would be able to have the product served on their table.

The lack of chickens in the Northwest is not because of unsuited climatic conditions or soil defects or the presence of any dreaded disease, but merely because the man who owns hundreds or even thousands of acres of wheat land will not "monkey" with what he terms "peanut business," while the individual working on the ten-acre tract specializes either in apples, pears, peaches, cherries or some other fruit or vegetable, and does not take time to enther encourage or care for his dozen or so "scrubs."

The Walla Walla Poultry Association has awakened to the vast amount of money awaiting the experienced poultryman who embarks into the business, and is now carrying on a campaign in this section, trying to encourage the raising of good chickens both for eggs and table use.

Figures gathered in the city of Walla Walla alone show that the 20,000 people living within the city limits pay $1.25 per capita annually for eggs shipped in from outside points.

For the past twenty-four years, according to the local United States Weather Bureau, there has been an average of 282 clear days out of each 365, while the thermometer seldom registers zero weather. Last winter the coldest was seven degrees above zero, but eggs went to 70 cents per dozen and remained there during January and February. Those who owned chickens made handsome profits, but the supply was not equal to the demand.

As a result of these continued experiences, H. S. Buffum, of Walla Walla, has gone into the business for eggs alone. At present he has 1,000 birds. So far he has had great success and will enlarge as he can.

There are, however, a mere handful who have introduced "good poultry" in this section of the state, and these men, missionaries they might be termed, are working hard to make Walla Walla the Petaluma of the Northwest.

SEX OF EGGS.

There is no known way of determining the sex of the chick by the appearance of the egg. The theory of foretelling the sex of the future chicken by the formation of the egg is centuries old. In the writings of Horace, long eggs are mentioned as certain to produce males. The position of the air cell has also been supposed to indicate the sex. Several well-known writers of recent years have expressed the belief that long eggs or those having wrinkled ends would produce males and that the smooth, round ones would hatch pullets. There is absolutely no foundation for this belief, as may be easily ascertained by making a few test hatches.

Several English writers, and more than one American, attribute the control of sex to the condition of the male bird, and they apparently base their theory on good ground. Briefly, it is to the effect that when the male is full of vigor early in the season cockerels are likely to predominate in the chicks from his pen. Later in the season, as the male's strength and vigor (sexually) decreases, the number of pullets in his progeny increases. However, when the male bird apparently remains equally healthy, strong and vigorous throughout the entire season, it is a common thing to have a majority of cockerels early in the season, while later on pullets predominate.

From the same flock, with as vigorous males as could be obtained, the writer has had nearly two-thirds cockerels early in the season, while later, in June and July hatches, from 90 to 100 pullets have been obtained from a hatch of 150 chicks. This, however, does not prove or disprove the theory, and it is highly probable that other elements, which we do not understand or appreciate, enter into the question of control of sex in the offspring. It is a well-known fact that usually the generative organs of the male undergo considerable change at different seasons and the testes of the cock are usually largest and best developed at the height of the breeding season, which generally is in April.

There are many theories and methods proposed for the regulation of the sex of chicks, but thus far none seem to prove dependable when put to the test. It is a fact well known that some families are prone to produce females and others equally prone to produce males. This will apply to some breeding birds and some matings, and this may prove the true solution of the control of sex in so far as we can regulate it. If you have a male bird or a particular mating that gives you a larger percentage of the

desired sex in the chicks, you will do well to continue breeding it or from the same line as long as you can successfully, and take whatever sex of chicks you get with as good grace as possible. It is not probable that anyone will discover any infallible rule for the control of the sex of future chicks, either by selection of eggs or by handling and management of the breeding stock.—Am. Poultry Journal.

DECOMPOSITION IN DRAWN AND UNDRAWN MARKET POULTRY.

The results of the investigations into the comparative rate of decomposition of drawn and undrawn market poultry made by the U. S. Department of Agriculture during the season 1909-1910 have just been published in Chemistry Circular 70. The conditions of the experiment were strictly commercial, as the fowls were killed and dressed by the regular employes of a poultry packing house, were shipped in the usual one-dozen to the box package in a car lot of dressed poultry, were received by a wholesaler and handled with his stock, and went to the retailer when he purchased fowls from the same car lot, remaining in his shop for the period which the market happened to require for their sale.

The shipments extended over a period of six months, from January to June, inclusive, and the haul was about 1700 miles, requiring on the average 7½ days. The birds were mature hens, large and fairly fat, and the method of killing was by bleeding through the mouth and puncturing the brain through the skull just below the eye. The carcasses were dressed according to methods known respectively as "full drawn," "wire drawn," "Boston drawn," and some undrawn, all being dry picked, and the evisceration was conducted with sufficient care to render washing unnecessary.

The routine of dressing, packing and shipping, and general handling in these experiments is far above the average. In fact, if all market poultry should be handled so well, the problem of decay would become insignificant.

The investigations which are described in detail in the pamphlet demonstrate (1) undrawn poultry decomposes more slowly than does poultry which has been either wholly or partly eviscerated; (2) "full drawn" poultry; completely eviscerated with head and feet removed decomposes the most rapidly; (3) "Boston drawn" and "wire drawn" stand midway between the undrawn and "full drawn" in speed of decomposition, the "wire drawn," which is most like the undrawn, being usually the better; and (4) that these deductions apply to dry picked, dry chilled, dry packed, unwashed fowls, which have been marketed with what would be called promptness.

The effect of different methods of dressing in case of delayed marketing is now under investigation.

"An ounce of prevention is worth a pound of cure." This is as true in the poultry business as in any other. To prevent lice and mites getting a foothold in your poultry house, build it right. Have all of the interior fixtures removable. Keep everything as clean as possible, for the red mite will breed much better in dirty and filthy surroundings than where all is light and clean. To exterminate all kinds of vermin, nothing is superior to kerosene oil. Spray it into every crack and crevice in the house. Spraying is always much better than application with a brush, for it will penetrate farther and more thoroughly, so therefore, when using liquids, always work with a sprayer in preference to a brush.

The almost universal practice now is to disinfect eggs before incubating. This because the eggs pass through the cloaca, which also gives passage to the droppings, and are thus apt to receive any germs of disease from the droppings, which, in the warm, moist air of the incubator, may develop to the damage of the chick. Eggs can be disinfected with 95 per cent pure alcohol or with a solution of any of the preparations of tar or creosol. Dip them in and place on a cloth to dry. Do not put them on the tray wet, or the chances are they may stick to the tray and lose a bit of shell.

There are a hundred and one accidents lying in wait for the early chick, and the only way to head them off is to take every precaution now to have things in readiness for these early hatches. Have the coops clean and free from projections which might wound a chick. We once found a chick impaled on a projecting nailhead. Use fine litter; a long straw may choke a chick. Use very small-mouthed watering vessels. We lost a chick three weeks old by drowning in a pint fruit jar of water. Don't water the hen in a vessel a chick could drown in. The little creatures jump higher than one would think possible.—Wallace's.

There are at least five ways in which actual co-operation can take place in the poultry business. First, the co-operative marketing of eggs, the formation of egg centers for collection, grading, marketing, etc. Second, the establishment of central killing and packing houses. Third, the development of home markets. Fourth, the establishment of central hatching stations where mammoth incubators could do the hatching for the neighborhood. Fifth, the co-operative buying of feed.

Give the hens full range of the barn, stables and other farm buildings during the day, where they will have comfortable, dry shelter and will be able to glean much feed that would otherwise go to waste. Confine them in their own house at night so they will not become a nuisance in the other buildings.

Don't forget to have plenty of windows in the poultry house. Sunlight and fresh air are two things that all domestic animals need for health and good production.

Change the rations of your fowls occasionally to improve their appetites and keep them in healthful condition. Fowls do not thrive upon one food alone.

Baby Chicks

Gardena Hatchery, Gardena, Cal.

(Egg capacity 100,000)

Largest in So. California.

After May 1st we reduce prices on our **Baby Chicks.** Any one still in the market will do well to write for prices, as we can furnish them at a low figure. We guarantee a full count of **live** chicks at your Express office.

LOS ANGELES, U.S.A

California Cultivator,
Los Angeles, Calif.

June 12, 1911.

Gentlemen:

We take this opportunity of thanking you for the several flattering mentions you have made in recent issues of your paper relative to the fight we are making on behalf of the consumer buying his supplies at wholesale.

In this connection would say that we are being flooded with orders and inquiries from your thousands of readers, and have received many flattering letters from these people expressing their satisfaction with our goods and the saving they made on their purchases.

We are firm believers in the policy of producer to the consumer, thereby eliminating middlemen's profits and putting everyday necessities in the hands of the consumer at wholesale or less than wholesale prices.

It is unnecessary to say that we are receiving most liberal support at the hands of the general public, who recognize that our guarantee of satisfaction is bona-fide in every sense of the word.

You can advise your readers that we will have a full page of bargains in next week's Cultivator" that will save them from "30 to 40 per cent" after paying freight.

Thanking you again for courtesies, we are, Yours very truly,

P. S.—Tell your friends to send for our catalogue.

McSTAY SUPPLY CO.

FARM LANDS WANTED.

Farms Wanted—We have direct buyers. Don't pay commissions. Write describing property, naming lowest price. We help buyers locate desirable property Free. American Investment Association, 12 Palace Bldg., Minneapolis, Minn.

POULTRY

The Standard Poultry Yards. Back again with my first love. I have just received from the best White Leghorn breeders in the East 200 selected heavy-weight Knapp and Wyckoff trap nested White Leghorns, not one scoring less than 91 and up to 96 points. I am now prepared to furnish baby chicks and eggs together with my Cook and Kellerstrass White Orpingtons. I feel sure I have the best on the Coast. C. A. Loud, Prop., 3944 Cleveland Ave., San Diego, Cal

All We Know is Rhode Island Red Chickens. But we know them so well that our baby chix, $15 a 100, are the best on earth. There! Pure blood, good strains, well mated by expert breeders. I. X. L. Poultry Yards, 587 Mission St., Santa Cruz, Cal.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

The Goodacre Strains—Just the time to get our Quality Reds, our special offer on eggs from choice matings of $3.00 per 15 or $5 00 per 30 is hard to equal; our commercial day-old chicks we now offer in 100 lots at $12.00; our Reds have been constant winners the past three years in our Coast shows. We can sell you choice eggs, Buff Orpingtons, Anconas and White Runner Ducks. Write us today. Goodacre Bros., Compton, Cal.

BONNELL'S S. C. BLACK MINORCAS WIN EVERY TIME.
At Los Angeles Show, 1911, every first premium and two silver cups; two specials for best male and female. Eggs at half price, $2.50 per setting. C. C. Bonnell, 2919 Brighton Ave., Los Angeles, Cal.

Baby Chicks from my pure-bred stock S. C. White Leghorns, carefully selected for laying and standard qualities. $9.00 per 100, $85.00 per 1000. Eggs for hatching $5.00 per 100. Correspondence solicited. J. R. Heinrich Poultry Yards, Arroyo Grande, Cal.

R. I. Reds—Much time may be saved in producing heavy layers by buying eggs from a breeder who has established a record by specializing in heavy laying stock. Eggs, hundred $5.00, finely pointed; 15, $3.00. "The Luedkes," Anaheim, Route 1.

Rose Comb R. I. Reds—Eggs one-half price balance of season. A few breeders for sale. Young stock later. Mating list on request. W. H. Pickering, 984 E. 55th St., Los Angeles, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. Allaway & Layton Co., 607 E. Third St., Los Angeles, Cal.

White Leghorns—Buff Orpingtons. Bred for beauty and great egg production. Grand lot of both old and young stock for sale. Prices reasonable. Write your wants. Model Poultry Farm, Box H, Irvington, Cal.

Blue Andalusians—Beautiful and odd. Not too late to hatch if you have green feed. Eggs $2 per 14, $8 per 120. Two trios at $5 each. Have bred them 11 years. L. A. Wilson, Winters, Cal.

Rhode Island Reds—Eggs for hatching from high grade stock. Also some very choice cockerels, cheap considering quality. Write for prices. Frank Greenleaf, Greenleaf St., Santa Ana, Cal.

Day-Old Chicks and Eggs Only—Barred Rock; good laying strain. The Fairmount Hatchery, 29B, Rural No. 1, Santa Cruz, Cal

Orland Hatchery—White Leghorn chix, $8.50 per 100. $80.00 per 1,000. Brown Leghorn chix, $8.50 per 100. P. L. Simpson, Orland, Cal.

Hicks Jubilee Hatchery, now booking orders. Write us your wants. We use eggs from first-class stock only. Try us. W. J. Hicks, Petaluma, Cal.

White Orpington and White Wyandotte eggs for hatching. Send for list of winnings. Arthur W. Huskins, 713 Waterloo St., Los Angeles, Cal.

Barred Plymouth Rocks—The kind that "Win and Lay." Eggs and stock for sale. C. H. Vodden, Los Gatos, Cal.

Rose Comb Black Minorcas, nine years line bred. Stock and eggs in season. Eleanore Minorca Farm, R. D. 1, Los Angeles, Cal.

TURKEYS.

Mammoth White Holland Turkey eggs, $3.50 per 13 eggs, after May 26. A. H. Blakely, Ontario, Cal.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade, the live stock and poultry industries, are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles.

A GENTLE METHOD.

Little Edward had been visiting his uncle's ranch, where they were very much bothered by rats. When he came back, he started to school, where he received the information which he gave his grandmother one day. He said:

"Grandma, do you know how to get rid of rats?"

"No, Edward. How?"

"Why, a soft answer turneth away rats."—Woman's Home Companion for May.

THE SECRET.

Though it's hard to drive a hen, 'tis true,
It can be done if you're
Composed, and know the thing to do
Is just go slow but shoo 'er.

"How is it that your hens are so prolific?"

"I feed them on layer cake."—Lippincott's.

Sooner or later the chronic kicker will kick himself out.

A PROGRESSIVE MOVE.

The Trumbull Seed Company outgrew its quarters and last week moved into its new store at 257-259 Market St., San Francisco.

The enviable reputation enjoyed by this firm is the result of handling only reliable seeds and treating its customers in the best possible manner.

Seeds will be sold wholesale and retail. Special attention will be given to grass seed and green manuring crops. Besides seeds, the firm will handle Coulson's Standard Poultry Foods, bee supplies, sulphur, lime, and commercial fertilizers, together with spraying implements and supplies, insecticides, germicides, etc. The various departments will make it a most complete store.

A new catalogue will be issued later in the year, and you can register your name now and receive a copy as soon as it comes from the press.

MERCED COLONY.

Merced Colony No. 2, a tract near Atwater which is being colonized by the Co-operative Land and Trust Company of San Francisco, will have a large acreage in peaches within the next year. Following is a list of sales made in Merced Colony No. 2 during the week: John L. Winters, Alameda County, lot 45; Henry Wohlgemuth, Los Angeles, lot 127A; J. J. Ratzlaff, Los Angeles, lot 127B; A. E. Weingartner, Iowa, lot 63; A. O. Cooperrider, Santa Clara County, south half lot 36; J. O. Storey, Santa Clara County, lot 107.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Capacity of Barrel.

How many gallons of water in a barrel?—Subscriber, Dinuba.

The wine barrel contains 31½ gallons. This applies to all liquids in the United States, unless it is petroleum, barrel for which contains 42 gallons.

Centrifugal Lift.

How high will a centrifugal pump force water?—Subscriber, Dinuba.

In theory the suction lift is 33 feet, but in practice nature does not "abhor a vacuum" to that extent, and the pump is usually placed down as near to the water as possible. The lift or force above the pump depends upon the power used, for with plenty of power it is almost unlimited.

Boring Beetles.

I am sending beetles which are boring into the twigs or canes of prunes and apple trees and grape vines, weakening them so that they often break off.—Subscriber, Fulton.

These are the same as beetles sent us a couple of months ago from Riverside and reported from there as boring into orange tree twigs. They were referred to Prof. Baker of Pomona College and he answered that they were Polycaon belonging to the ptinidae. They are common in California and have never been reported to be of economic importance. We will be glad to have our subscribers keep us informed regarding this pest. The beetles are narrow bodied and about three-eights of an inch in length; one of the specimens sent us approaches a half inch. They make a clean, small hole in the hardwood of the twigs.

Fertilizer for Orange Tree.

I have young Washington Navel tree growing fairly well which I would like to stimulate and have grow as fast as possible. What is the best kind of commercial fertilizer and what amount should be used? How should it be applied?—Inquirer, Reedley.

Our inquirer must bear in mind that there is a limit to the growth of a tree and sometimes extra forcing results in gum disease or other troubles, but within reason it is desirable. We would first get the ground in the best of physical condition. If stable manure is at hand, spade it in and work the soil up loose and mellow. At this season of the year if stable manure is not available, then one pound of nitrate of soda well distributed for some distance about the tree will increase immediate growth. Any complete commercial fertilizer made up by a reputable house will answer the purpose and may be applied at this season. It should be spaded in or spread on the surface after irrigation and then worked into the soil. Above all, keep the ground mellow and in condition so that the sun will keep it warm. The two things necessary to best condition of roots of orange trees are air and warmth in the soil.

Draining Heavy Land.

I have land which in wet seasons runs together and the water stands in low places. I have been told that if this land were subsoiled to a depth of 12 or 14 inches that it would absorb the rain water. What should I do in the case?—Subscriber, Colusa.

Whether subsoiling this land would be beneficial or not can only be known by an examination of it. If the soil is a shallow one over hardpan with a good mellow subsoil below, opening it up by subsoiling might be sufficient to pass the water through to the better soil underneath, but we do not think 12 or 14-inch plowing would do that. If the hardpan is deep or thicker than could be handled by the use of a regular subsoiler plow, then it is probable the use of dynamite to break it up would be advisable. Powder mill people are holding demonstrations to show advantages of subsoiling with dynamite and within the next few months it is probable we will know more about it. If subsoiling would not work in this case then it is probable the only recourse would be to tile draining. Such land should be wonderfully benefited by tiling, but as noted above, owners of such lands should inform themselves more fully as to the under surface conditions. In the absence of a regular soil testing tube, the ordinary post hole digger with possibly an extension on the handle will help to give this information. Go down four or five feet or more and learn what is in your soil.

Bowel Trouble of Little Chicks.

A subscriber at Santa Ana asks what to do for bowel trouble in little chicks.

Discover the cause and remove it. The usual causes of bowel trouble in little chicks are taking cold, and lice. They take cold from overcrowding at night and coming out in the morning in a perspiration, while the lice or mites reduce the vitality. If our inquirer had mentioned whether the chicks were hen hatched or incubator chicks and whether they are brooder chicks or raised by a hen it would be easier to guess at the cause of this trouble. Give the chicks rice boiled in milk, adding a tablespoonful of ground cinnamon to each pint of milk. Also chop up onions, at least one good-sized onion every day for a dozen chicks, and mix it with the food. Give all the lettuce they will eat, and follow our rules of feeding chickfeed.—A. B.

Lizard Trap.

For the benefit of the bee keeper who has had trouble with lizards I may suggest a trap which has been quite effective. It consists of a five-gallon coal oil can with the top cut out. Over the top is tied a piece of paper in which cross slits are cut so that the lizards walking above it will drop to the bottom of the can. The can is sunk in the ground with the top nearly level with the ground near the place where the lizards pass. The sides being perpendicular and smooth, once in, the lizard is unable to crawl out. The bait is placed at various points on the paper.—Harold B. True, Lancaster.

Mr. True does not state what he uses for bait, which we think would be important.—Ed.

WEBER WAGONS

It was in 1845 that the first Weber wagon was built. From that day to this every effort has been made to build them the way the farmer wants them. Think of it—sixty-three years of steady advancement. It is no wonder that they are known as "King of all." Every element of excellence in wagon construction is embodied in the Weber. The best quality of material is used; it is properly constructed, and attractively finished.

Irrigation and Forestry

GROWING AUTOMOBILES BY IRRIGATION.

In 1726 Dean Swift wrote: "He that maketh two blades of grass grow where only one grew before is greater than he that destroyeth a city." If he were writing today he could truly say that "he that maketh two blades of grass grow where none grew before shall bring the city to his farm and burn up the road in his automobile."

Whatever else irrigation in California has been productive of, it has certainly raised amongst the farmers a crop of automobiles, and if the steady procession of horseless vehicles to country districts continues, the hitching-post will soon be as much a thing of the past as the "old oaken bucket."

While the beginning of irrigation by gravity flow dates back to the dawn of history and the greatest of landmarks of early civilization are the remains of ancient irrigation systems, it is only within the memory of the present generation that the practice of irrigation has advanced to where it is a distinct branch of engineering science.

All over the western country where large irrigation systems have been installed, water from the mountains being impounded by dams or pumped from rivers, vast tracts of arid land have been turned into fertile farms; but it is rather to the individual pumping plant that the automobile manufacturer owes so much of his trade.

Irrigated farms justly command a high price and the transforming of the desert into such has called forth the original investment of so much capital that the work has been done by large corporations, and the farms are being sold with the water already on them and a practical guarantee of profitable operation.

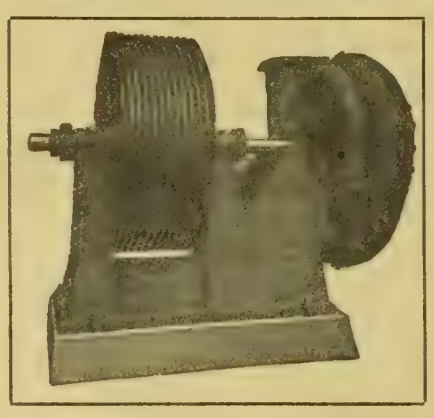
The farmer who took up land years ago and eked out a precarious existence is the man who owes to irrigation the comforts of life and the freedom from the never-ending worry as to Nature's pranks. In place of the dilapidated, unpainted ranch house of the old days, we see everywhere the comfortable bungalow with wide porches and modern plumbing, and in many cases an individual lighting plant. The tumble-down barn has disappeared and in its place the neat garage through its open door discloses the hall-mark of prosperity—the automobile.

That the use of the machine has revolutionized country life can not be gainsaid. What matter now if the nearest neighbor is ten miles or more away? What was before a formidable journey and one that was more often than not put off to save the horses, can now be accomplished in a few minutes. Social calls and evening gatherings are possible without the necessity of taking lunch along or staying all night, and the weekly pilgrimage to town is now a few minutes run in the automobile and can be taken daily. Surely irrigation has not only changed the face of the land, but the life of the land owners as well.

If we want to see more of the actual agent that has made all this possible, it is generally necessary to go back from the roadway a little further than our glimpse of the bungalow and garage requires. Undoubtedly today in spite of the comparatively cheap electric power that covers the country with a network of wires, the gasoline engine is by far the most popular power for pumping.

Strangely enough the common use of the automobile bought from the proceeds of the pump driven by a gasoline engine, has in itself increased tremendously the successful operation and consequently the growth of sales of stationary gasoline engines. The days of the professional gasoline engine "trouble-man" are numbered and the old chestnut of the dealer in gaso-

We Give It to You Free of Charge



If we offered to furnish you a pump for nothing you would be willing to pay a reasonable amount for expert advice as to the type of pump which would be best for you to take, because you would be saving money

American Pump Co., 341 South Los Angeles St., **Los Angeles**

line engines, that he had to send a man a hundred miles to find out that his customer needed gasoline to make his engine run, will be heard no more. Not only has the knowledge of the practical working of a gasoline engine necessary for rightly running an automobile made every automobile owner a "trouble-man" himself, but the development of the engine itself and the improvements made in connection with it have been so great that the old feeling of satisfaction when an engine ran at all has given way to a feeling of surprise if it does not run.

Wherever conditions will permit, the centrifugal pump is the one used for irrigating purposes, and just as in the case of the gas engine the increased use of this type of pumping machinery has returned in improvements which have placed the centrifugal pump in the front rank for efficiency, although there is still a prevailing opinion that the centrifugal pump is only suitable for low-head work and at great power expense. It is no uncommon thing to have a centrifugal pump pumping from six, eight and even ten wells and set down in a pit lifting the water from 50 to 100 feet altogether.

"Agricultural engineer" is a new profession and many a dollar has been saved by the cautious farmer who has consulted one of these experts before installing the automobile producing machinery. The government, too, maintains a corps of experts who are constantly compiling statistics covering the subject of irrigation, and are only too glad to test out and report upon irrigating plants anywhere in the country. Some of the engineering concerns who have made a specialty of the sale and installation of irrigating machinery have in their employ experts whose advice can be safely relied upon.

There is no reason why the farmer who wants to raise an automobile by irrigation should make any mistake or take any chance in the kind of machinery to which he looks for so remarkable a crop.

NEW POWER SITE WITHDRAWALS

Three new power site withdrawals of public lands were made during the month of April, based on the field work of the United States Geological Survey. The land included in the withdrawals aggregates 97,889 acres.

There were also restored to entry portions of former withdrawals, found upon examination not to be necessary to the protection of government power sites.

The policy of the government, as stated by the director of the Geological Survey, in the matter of the classification of the public lands, is, first, to withdraw such areas as may be considered necessary from the standpoint of the federal government in the protection and conservation of its mineral and water resources; second, to make such withdrawals as accurately as possible, on the basis of the data or information available; and, third, to make further investigations and secure additional data in order to restore if possible any areas not absolutely necessary to the protection of the people's interest. In many cases the restorations represent the actual demand, in the form of petitions, for the use of the land for other purposes than those for which the withdrawal was made, and if full investigation shows this land to be most valuable for the use contemplated by the applicant, then the principle of relative worth becomes the deciding factor. This is simply carrying into practice the broad scheme of the classification of the public lands so as to secure their devotion to the highest and most beneficial use.

A cement ditch having a capacity of 900 miner's inches is being constructed to carry water from the Whitewater River to lands above Banning.

Are You an Expert?

If you are, every point that we claim for

Z-S Engines

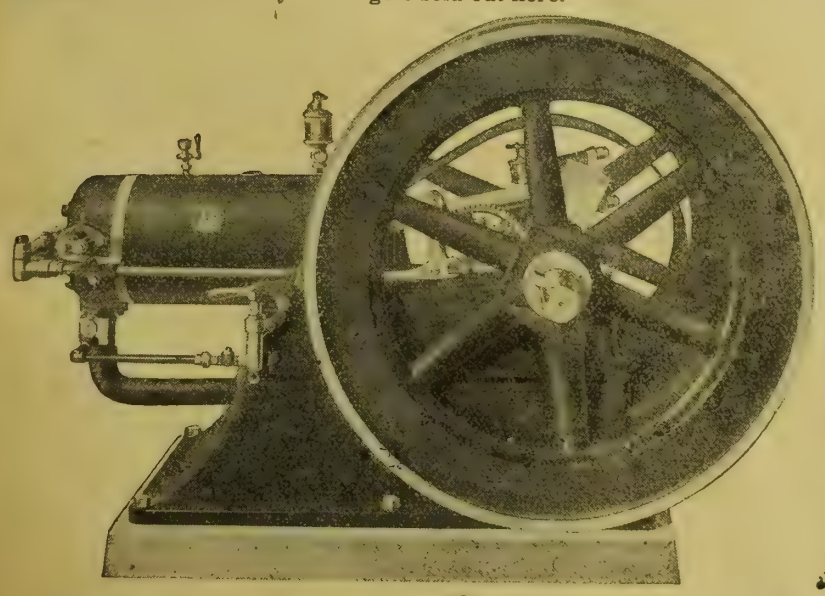
will appeal to you as of ***vital importance,*** and you will realize that the man who designed an engine combining practically all the essential features and many unique improvements, and at the same time preserved the three essentials,

Simplicity Reliability Economy

knows ***what a gas engine should be.*** Paul F. Schryer convinced us, after we had been dealing in other gas engines for years, that from many standpoints he had produced the

Most Desirable Engine on the Market

Let us tell you what, as experts, appealed to us and caused us to add our ***guarantee*** to his of every Z-S Engine sold out here.



Vital Points

Design ***Horizontal,*** of course, because it's stronger; because the piston is more thoroughly and evenly oiled, and because it runs with less vibration and gives more power than a vertical. ***Frame*** is long and deep, has heavy bed ledges to support cyclinder (which should ***never*** be bolted on to the end of the bed and overhang, nor should it be cast in one piece with bed). Notice the 30 degree bearing boxes.

Crankshaft Forged without joint or weld from a solid piece of best steel—nothing else will do—no cast steel or malleable iron—and it must be finished all over, showing there are no flaws which paint can hide.

Cylinder separate from the bed but thoroughly supported by it. Large water circulating passages. Compare the bore and stroke of ***Z-S*** cylinders with other engines.

Igniter is "make and break," set in the cylinder head, as are both exhaust and admission valves. Head can be easily removed and valves reground right in place in it. ***Igniter points can be cleaned from outside without removing.***

Large Valve Area Valves are of the poppet type, 25% larger than commonly used. This means ***longer life, more power, less gasoline.***

Speed Controller is hit and miss with governor weights in the fly wheel. All ***Z-S*** Engines above 2 H. P. have ***speed changing device*** operating directly on the governor and enabling you to increase or decrease speed of the engine one-third from standard while running and without danger.

Fly Wheels are especially heavy in the rim, and this accounts largely for the ***perfect balance and smooth running*** of ***Z-S*** Engines.

These are some of the ***POINTS*** that sold us

Z-S Engines

If you want them in detail write us today for Paul Schryer's book:

APPELL'S South African WATER BAG

Keeps water cool 48 hours or longer, in sun or shade: great boon to prospectors, surveyors, sportsmen, stockmen, farmers, teamsters, anyone exposed to dry or warm weather. Used by U. S. Gov't. Strong, light, easy to carry. Guaranteed

Take no Substitute

This Letter Typifies the Attitude of All Users

Gentlemen: Elkhart, Indiana.

While in Nevada recently I had occasion to drink out of one of your South African Water Bags. Water from the bag certainly tastes good on the desert. We used one of your 2½ gallon bags and *the water remained cool all day, even though the temperature was over 100 in the shade*, and in the morning I found the water sparkling and as cold as ice water. It certainly is a boon to those living in the arid regions.

Yours Sincerely, W. E. WIDER

Household Department

"SUCH AS I HAVE."

The little maid sat in the high-backed pew,
And raised to the pulpit her eyes of blue;
And the prayers were long, and the sermon grand,
And oh, it was hard to understand!
But the beautiful text sank deep in her heart,
Which the preacher made of his sermon a part;
"Silver and gold have I none," read he;
"But such as I have give I to thee."
And the good old preacher looked down and smiled.
At the earnest gaze of the little child.

The dear little maid carried home the word,
Determined to use it as chance might afford.
She saw her mother unceasingly
Toil for the needs of the family,
So she cheerily helped, the long day through,
And did with her heart what her hands found to do.
"'Silver and gold have I none,' said she,
"'But such as I have give I to thee.'"
And the joyful mother tenderly smiled
As she bent to kiss her little child.

On her way to school tired, I know,
She plucked the blooms by the wayside born;
"My teacher is often tired, I know,
For we're sometimes naughty, and sometimes slow;
Perhaps these may help to lighten her task,"
And she laid the flowers on her teacher's desk.
"'Silver and gold have I none,'" said she,
"'But such as I have give I to thee.'"
And the weary teacher looked up and smiled
And she took the gift of the little child.

As she played with her sisters on the grass,
She saw a dusty traveler pass.
"Poor man," she said, "He's tired, I think,
I'll go and get him a nice, cool drink."
And she hastened to fetch her little cup,
And dip the sparkling nectar up.
"'Silver and gold have I none,'" said she,
"'But such as I have give I to thee.'"
And the thirsty, dusty traveler smiled,
As he took the cup from the little child.

Sweet and innocent, clad in white,
She knelt by her little bed at night.
With a childish trust she longed to bring
Some gift to her Savior and her King.
"So much from thee every day I receive;
But my heart is all that I have to give.
"'Silver and gold have I none,'" said she,
"'But such as I have give I to thee.'"
And our Father looked down and tenderly smiled
As he took the gift of the little child.
—Elizabeth Rosser in the Watchman.

HOW THE QUESTION WAS SETTLED.

Katharine Atherton Grimes.

"How is Fred doing in school this winter?" asked Farmer Grey of Mr. Hall, the teacher, whom he had overtaken on his way home from school.

"Fred is doing well—extra well, I may say," replied Mr. Hall. "In fact, I have never had many pupils who have advanced so rapidly."

"I am glad to hear it," said Mr. Grey, heartily. "It means a great deal to his mother and me to see our only son making a success of things that he undertakes. Of course he is young yet—only fifteen—but one can tell a good deal about the stuff a boy is made of, even at that age."

"That is true enough," replied the teacher. "I have been wanting to see you for some little time to ask what line of training you wished him to be given especial work in. It is quite time some definite plans were being made for his future."

"Just what I told Mother last night. By the way, I am coming back by way of your boarding place, so just jump in, and we can talk as we go along."

Mr. Hall climbed into the buggy, and the two men drove away, talking earnestly about the prospects of the bright lad in whose future both were so deeply interested.

"Fred would make a brilliant lawyer," said Mr. Hall, in the course of the conversation. "His mind is remarkably clear, and he is quick to see and profit by any point that comes under his observation. He has a solid sense of honor, that would insure him against the common, claptrack practices, and would eventually make him a power in legal circles, for, in spite of all that is said, it is the right kind of men that tell there, as elsewhere. I should strongly urge that profession, as it so often proves a stepping stone to great things. But it is, of course, not the only one open to a young man of Fred's ability."

Mr. Grey shook his head doubtfully. "I do not know what to think," he said, slowly. "His mother has set her heart upon his being a merchant of some kind. You know her brother is the head of the Allen Mercantile Company, at Tuxedo, and could, and would, give the boy an excellent chance to learn the business from the bottom up."

"He would undoubtedly succeed there, too," acquiesced Mr. Hall. "The same qualities that make a fine lawyer would tell equally well in that occupation. In fact, with the proper training, I sincerely believe Fred could make a success of any business requiring brains and energy, providing he has a taste for it."

"I will talk with the boy, and see what his own inclinations are," said Mr. Grey, finally as he stopped to let the teacher out at his boarding place. "He has a right to decide for himself. I would not force any line of action upon him, against his own preferences. My own judgment might easily be at fault, even with my own son."

"I do not think you stated what you would yourself like him to be," said Mr. Hall.

"Me? Oh, if I could have my own wish, I would rather see him just a plain farmer than anything else. To my mind no profession is nobler, or offers greater opportunities to a young man with 'brains and energy,' as you remarked a while ago. But I realize that I may perhaps be prejudiced in favor of a calling that appeals strongly to myself, yet might prove a sad misfit for my boy."

The teacher watched him thoughtfully as he drove down the road.

"I wonder if it would be a 'misfit,' after all," he mused. "Brains, energy and honor are needed on the farm as much as elsewhere. The leading farmers of the time to come will be the men who can command these qualifications in the greatest degree. The chances for financial success are just as good on the farm as anywhere else, if anything, it offers the lesser risk of failure. Fred has the further advantage of having been brought up by a practical farmer on a well-managed farm. He has had example as well as precept to learn from. On the whole, I believe it would be the best thing for him to stick to his father's calling.

"I believe I will talk with the boy a little myself. I should have done so before, but I had an idea that Mr. and Mrs. Grey, like most parents of exceptionally bright sons, would have some great ambition for their boy that would take him out of their own walk in life. I should like to know what Fred himself will say, when they mention the subject to him. He is quite capable of making his own choice."

Fred Grey came to school a little earlier than usual the next morning. Mr. Hall heard the clear, musical whistle coming, far down the road. He watched the tall, well-knit young figure swinging toward him, and noted with pleasure the open, honest face, and the dark eyes with the dawn of manhood beginning to make keen glints in them. The teacher felt that his own interest in the lad was, perhaps, excessive, yet could not wonder at it.

"Good morning, sir," said the pleasant young voice, which had a little new note of suppressed excitement in it. "I have great news to tell you this morning. That is why I am so early. I could not wait," he added, with a laugh.

"I guessed as much," said the teacher, almost as excited as the lad. "Come in and tell me all about it."

"Father is going to give me a deed of the south forty tomorrow," cried Fred jubilantly. "Isn't that the best ever? If I make a success of that, when I am twenty-one he promised to give me the forty joining it. I am going to pay my way through the Agricultural College with the proceeds of my crops. Father says you are to come home with me tonight to help me make my plans."

"Then you are not to be a lawyer,

Do Your Buildings Need Paint?

Examine your buildings and see if they need painting now. If they do, don't put the work off because you believe linseed oil will drop in price. There is no hope of it. Besides, the price of paint made-to-order of

"Dutch Boy Painter"

White Lead and pure linseed oil is lower than you may think, if you have not actually figured it.

VACATION LAND

The Playground of California
Lies close to San Francisco along the line of the
NORTHWESTERN PACIFIC RAILROAD

Hundreds of delightful places in which to spend your summer outing. Choice river, forest, seaside, mineral spring or mountain hotels, resorts, ranch houses and camping sites, where accommodations can be secured to suit any purse.

VACATION 1911

tells you all about it, with rates, distances, accommodations and full particulars.

LOW VACATION RATES

Copies and full information may be obtained from ticket agents, 874 Market St. (Flood building), Sausalito ferry or on application to J. J. GEARY, Gen. Pass. and Freight Agent, 886 Flood Building, San Francisco, Cal.

Copy of this book can be had at Southern Pacific office, Los Angeles.

or a merchant, or any 'big gun' of that sort " asked Mr. Hall, with a little smile.

"I should say not!" replied the boy emphatically. "Father said something about that, too, I believe, but I did not pay much attetnion. I have never thought of being anything but the best kind of a farmer, just like dad."

"You will be," said Mr. Hall, decidedly. "You are the right sort for that very thing."—Successful Farming.

PAPER PLASTER AND HOW TO USE IT.

"Paper plaster is one of the most useful and durable mediums for decoration," says Woman's Home Companion for March. "It may be used on small or large surfaces, and even in unskilled hands charming results may be produced with it.

"Take old newspapers and tear them into very small pieces. Put a mass of them in a tub of water and allow them to soak over night. In the morning put the whole mass through the meat-chopper. Wet it again so as to make it pliable like plaster. Practice modeling the paper into different shapes while it is in this state, but remember, of course, that it will not be permanently cohesive. After you have learned to handle the pulp mix it with a little glue. It will remain soft for some days and can be molded without haste, but as time goes on, the molded plaster will become hard.

"Old glass bottles may be covered with the plaster and decorated in any way that you may fancy. Well-shaped jars may be decorated with designs of fruit or flowers. When the pulp dries, it takes on an attractive bronzy color without treatment of any sort. Soft brown or green dyes may be worked in with the plaster, however, and produce charming effects.

"Glove or handkerchief cases may be made from ordinary wooden boxes. For a handkerchief case, cover a cigar-box with the paper pulp, working in some simple and appropriate design, pinching it and modeling into shape. For this purpose use a narrow paper-knife and make the more delicate touches with the flattened end of an orange stick. Pad and line the inside of the box with silk.

"Very pretty bas-relief effects may be made with the plaster. It may be used in executing low-relief wall designs for borders or friezes. If you wish a conventional design or figure, cut as many patterns of the same design as you will need for the space to be covered. Paste these securely on the surface to be decorated and mold the pulp over them. Keeping the pulp neatly within the lines will insure accuracy and uniformity. When the design is modeled the pulp may be colored with water-colors dabbed on with a sponge or with a large soft brush.

FROM DAY TO DAY—A RECIPE.

Wouldst thou be wretched?
'Tis an easy way;
Think but of self and self alone, all day;
Think of thy pain, thy grief, thy loss, thy care—
All that thou hast to do, or feel, or bear.
Think of thy good, thy pleasure, or thy gain,
Think only of thyself—'twill not be vain.
Wouldst thou be happy? Take an easy way;
Think of those round thee—live for them all day.
Think of their pain, their loss, their grief, their care,
All that they have to do, or feel, or bear.
Think of their pleasure, of their good, their gain;
Think of those round thee—it will not be vain.

—Credit Losts.

RUBE!

Hotel Proprietor—"What's all this ringing about?"

Guest—"I dunno. I've lost my collar button an' I'm trying to dig this little one out of the wall."—Judge.

When boiling anything needing constant stirring, a large glass marble placed in the kettle is far better than a spoon. The boiling keeps the marble moving, and prevents burning.

It makes the mind very free when we give up wishing, and only think of bearing what is laid upon us, and doing what is given us to do.—George Eliot.

San Francisco-Los Angeles Produce Markets

Los Angeles Market

LOS ANGELES, June, 14, 1911.

We believe the following from a Los Angeles daily paper is overstated and we do not reprint it to endorse it, but that such merit as it does possess may be a warning against the sending of poor stock to market. The paper says:

"In former years Los Angeles was the logical outlet for fruits and vegetables of Imperial and Coachella Valleys. Since the eastern markets have been discovered, the Southern farmers and packers have come to regard the local market as a mere dumping ground for any overripe, undersized rot they may have on hand and that may possibly pay more than the express charges, all amount over being profit. This season so far has been the worst ever experienced and the wholesalers are finally beginning to arise against the prevailing condition of affairs. Yesterday several carloads of the poorest cantaloupes that have ever been seen on this market were shipped in. They were soft, shipped in un-refrigerated cars, were poorly packed and in order to move them, they were sold for as little as $1 per standard crate. This rebounds upon the market for good stock. It kills the demand for fancy melons and at the same time forced the prices lower than they should be. The same is true of tomatoes. Some of those arriving yesterday morning were of such poor stock that they were sent straight to the garbage incinerator, while it was necessary to repack nearly every crate of Imperial Valley tomatoes that came in. It is in the interest of the grower as well as the wholesaler to pack only good stock for the reason that it keeps prices up here as well as in the East and the sooner he realizes that fact he will be better off. The same thing may be said of some local farmers. Sweet corn at the present time is a glaring example of mismanaged gardening. Day after day big shipments of corn arrive. Half of it or more should be left on the stalks for another week, being so green that it does at best only for horse feed or chicken feed. All of this green corn is shipped in with the hope of getting the prevailing high prices but instead most of the shippers do not get even the shipping cost and at the same time they keep the market up fearfully high, on really fancy stock."

Butter.

Butter receipts are about 60,000 pounds daily, demand good, market firm at last week's quotations.

Prices to trade 2½c in advance of the following Produce Exchange quotations:

Hay.

Receipts of hay for the past week have been 2776 tons. The market is being almost totally supplied with old crop, the only new crop arriving being an occasional boatload of first-cutting alfalfa, which is not thoroughly cured, and is being placed at about $6.00 to $6.50 per ton. The quality of this new alfalfa is very good; in fact, the best we have seen in some years. We understand the alfalfa acreage is very large. If all other grades of hay of the coming crop prove as good in quality as the first of the alfalfa seems to be, we will no doubt have hay of excellent quality to handle throughout the year.

Reports from the country continue favorable to larger crops of hay than have been anticipated. Sections which heretofore reported an exceedingly light crop are now reporting everything being cut for hay. We are now looking for almost a normal crop of hay throughout the state. The cool weather conditions have also helped the grain yield.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	.13.50@14.50
No. 1 wheat or wheat & oat	.11.00@12.00
No. 2 wheat or wheat & oat	.10.00@11.00
Choice tame oat	.10.00@12.50
Other tame oat	.8.50@10.50
Wild oat	.9.00@10.00
Stock hay	.6.00@8.00
Alfalfa	.9.00@10.50
Straw, bale	.40@50

Grain.

Barley, fancy	.1.36¼
Barley, good to choice	.1.32½@1.35
Barley, poor to fair	.1.27½@1.30
Oats, white	.1.50@1.60
Rye, new crop	.1.45@1.47½
Mustard, brown	.5½
Alfalfa seed	.5½
Millet	.2¾@3½
Flaxseed	.5@5½
Broom corn seed, ton	.25.00

Feed Stuff.

Cocoanut cake, ton	.25.50@26.50
Mixed feed, ton	.25.00@27.00
Shorts	.29.00@31.00

Deciduous Fruit Market

SACRAMENTO, June 10th, 1911.

Manager McKevitt of the California Fruit Distributors reports:

The following gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, June 9th, 1911:

Cherries—40 cars. Cherry shipments show a marked increase. The early sections are now finishing on this variety and the later and larger varieties are just beginning in the San Jose section. Royal Annes and Bings have been of better average quality than the Tartarians. In the San Jose section all varieties are reported as unusually fine.

Apricots—4 cars. Considerable quantities of Royal Apricots are now moving from the Winters and Vacaville section. Pringles and Seedlings are nearly done.

Peaches—This variety of fruit continues in very light supply. A material increase may be expected in the next week or ten days.

Plums—Two or three of the early varieties of plums have made their appearance, but shipments will be of exceedingly small volume for the next week, after which time they will be in liberal supply and of several of the leading varieties including Cherry Plums, Clymans, and possibly a few Climax.

Pears and Grapes continues to look very promising. The crop of the former will be considerably better than was expected earlier in the season. From present appearances it is likely to equal that of last year. Barring unforeseen climatic conditions the grape crop bids fair to be considerably larger than ever before.

Weather—At the time of writing our last letter, weather was pleasant. Since that time, however, on the 6th instant, we had quite a shower of rain, which fortunately did not amount to more than a light mist in most of the sections where cherry shipments are being made; consequently little or no damage resulted. It is not often that we get rain as late as the 6th of June, and it is not expected that any more moisture will fall until late in the fall.

Citrus Fruit Market

LOS ANGELES, June 14, 1911.

The orange market has been somewhat weakened in the cleaning up of the Navels, Seedlings and others of the earlier varieties. In fact, they are still selling at the Eastern end, though the shipping of all excepting the Valencias has ended. Nearly 3000 cars of Valencias have been forwarded or will be within the next week or two, so that it will not leave over 5000 to be shipped after the Fourth of July trade.

Lemons could hardly be better in the general run of the market. Favorable weather conditions—that is, extreme heat—forces them up occasionally above normal, but the ordinary run will not vary much from $5.00 to $6.00.

Shipments.

Shipments of oranges since November 1st, 1910, to date: 30,908 cars, lemons 4,463, total 35,371. To same date last season: Oranges 21,232, lemons 2,879, total 24,111.

LOS ANGELES, June 12.—Seven cars Valencias, one seedlings, three lemons sold.

MERCED COUNTY.

(Continued from Page 711.)

notably that of John Osborn, have been bearing prolifically for over twenty years. Although most of the newcomers of this part of the state are going in for alfalfa, in connection with dairying and hog raising, many are also setting out peach orchards. The thousands of acres already in successful bearing furnish ample proof of the excellent qualities of the soil for peach growing.

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth Street, Los Angeles.

AUTOMATIC
Cream Separator

CRANKLESS and GEARLESS

Nothing like it has ever before been invented. One size machine for any size dairy. The drudgery of dairying now a thing of the past.

It separates the milk perfectly faster than ten men can milk it.

Start the separator when the milking begins and it being both automatic and continuous in its operation, when the farmer is through milking he is through skimming.

Speed of bowl brought up in 15 seconds and will run for hours without the slightest variation.

It is destined to revolutionize the dairy business.

We are at least FIVE YEARS ahead of all competitors.

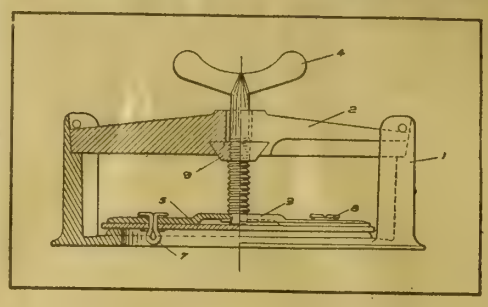
Save Money By Buying This Good Second-Hand Pipe

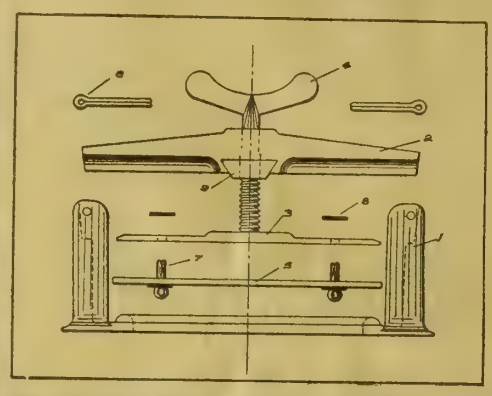
We can supply you with any size and quantity of Standard Pipe or Casing—all new threads and couplings—all stock guaranteed first-class.

If thinking of buying any kind of pipe, your best interests will be served by writing us for prices and particulars.

PACIFIC PIPE CO., Main and Howard Streets, SAN FRANCISCO.

POMONA CIRCULAR VALVE





THE main object of the Pomona Valve is to construct a very cheap and simple valve, and one that requires no special tools or wrenches or experience to operate.

The Pomona Valve is constructed with non-corrosive parts, thus insuring a workable valve regardless of infrequent use. All fastening held in place by cotter pins, thereby making a very cheaply constructed valve and yet a very substantial one.

Cotton King Disk Harrow

This harrow is symmetrical in design and strong enough to withstand the heavy work which a disk harrow encounters in a field. It is equipped with three steel standards, which insures great strength and will not clog when working over freshly-plowed ground or among clods. It will work equally well in any condition of soil, no matter whether the field is sandy or soggy. The gangs respond promptly to the levers so that the driver can easily adjust the disks to work at any desired angle. The frame is high and the disks can be so extended that there will be ample room for passing the plants when using the harrow as a cultivator. The levers do not extend below the tongue where they would interfere with the plants being cultivated. This disk harrow is just what you need. Come and investigate.

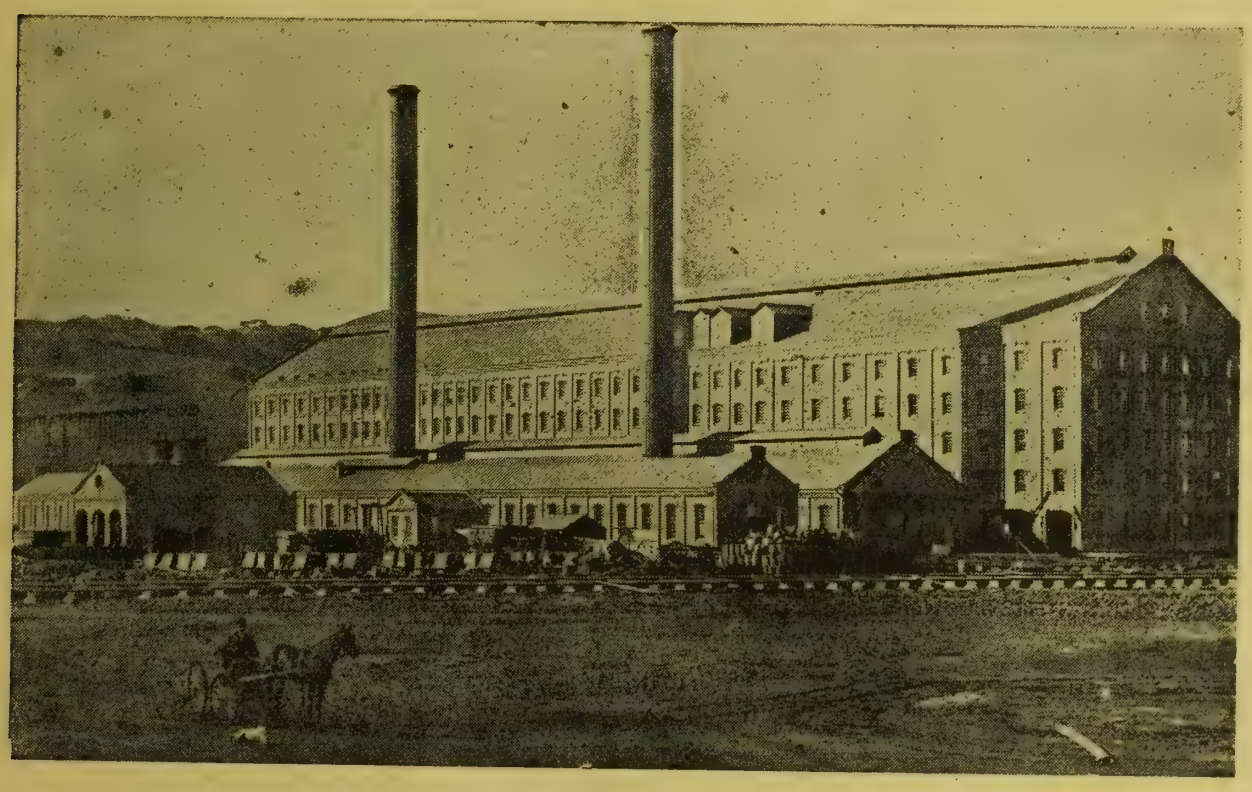
Sugar Beet Growers Gather in Institute

Editorial Correspondence from the Salinas Valley, Where Sugar Beet Growers are Alive to the Advantages of Institute Work

Last week I stood in the sewing room of the Spreckel's Sugar Factory and saw some of the most rapid work in the sewing line that it has ever been my pleasure to witness. It may seem somewhat peculiar to refer to a sewing room in the largest sugar factory in the world, but that is quite an important factor in this particular factory, and we doubt not in every other factory in the country. The young ladies who were manipulating the sewing machines seemed to enjoy the work, and the whirr and rush of the machines was indescribable. It was anything but a pink tea function, for there were no words between stitches. This may be appreciated when the fact is mentioned that with watch in hand an actual count was made of the sugar sacks turned out from one



Sugar Factory at Spreckels.

of these machines, exactly seventeen and one-half in one minute. The making of the sacks consists of picking up the cloth which has been cut to the right size, running a seam down one side and across the bottom. Before one fairly leaves the needle of the machine another is placed close behind it and on goes the endless stream of sacks. Later another attendant picks up the sacks, cuts the thread between them and puts them in a neat pile for the coming season's sugar output. To go back a step in the making of these sacks. We do not know the name of the first machine to which the cloth is delivered, but it has close to human intelligence in its handling of cloth. It measures and puts it into shape for the sack, then clamps it for the attendant to use his "saw" to cut it. This saw is not supplied with teeth, but is more like the ordinary hay knife, or as the ladies express it, like a Christie bread knife. The edge is sharpened with a very coarse stone. After cutting the bale of cloth with this saw or knife, the stack of unsewn sacks is delivered to the girls at the machine before described.

These are the thin muslin sacks which are placed inside the coarse jute which is made in a similar way and an ingenious contrivance is provided for fitting the thin sack within the coarser one, which is done before the sugar is placed in it. This is but one of the activities. One could not imagine a more interesting place to visit than a sugar factory when guided through it by one thoroughly understanding each process. As noted, this has the greatest capacity of any sugar factory in the world. To convey an idea of its size, we may mention that 3000 tons of beets daily may be easily handled in the height of the season.

It was the pleasure of the writer to be shown through this factory by Mr. R. L. Adams, who is in charge of the Experiment Station connected with it. It is unique in this, that this factory is the only one in the country which is maintaining such an Experiment Station service. A description of that service is sufficient for another article at another time, but is it not of interest to know the various steps from sugar beet to beet sugar?

We will not cover the ground or field handling, but take the beets on delivery at the dump. Even the sight of these great bins is inspiring. As the beets are dumped either from train or wagon, they rest in a bin over a chute through which water is constantly running. To carry them to the mill it is only necessary to open the chute and let the beets fall into the running water. They are then carried along to a great wheel which lifts them to a higher level and brings them even with another wheel next to the mill, some hundreds of yards away. As they flow along the chute the dirt is all removed and an occasional grating allows it to drop away from the clear running water. At the mill another wheel carries them to the great screw elevator which lifts them to the slicers. They are sliced into shreds, so cut as to open the greatest number of cells. The pulp is next transferred to the diffusion batteries where it is submitted to the action of hot water. This water and the heat extract practically all of the sugar from the pulp which is then taken in conveyors to the pit or silo at some distance from the mill, or dumped into cars and carried directly to feeding yards, sometimes miles from the mills. Many have felt that the pulp is not suitable for stock food because of the chemicals with which it comes in contact, but as a matter of fact no chemicals whatever touch the pulp.

The next step is the heating of this water containing the sugar so as to coagulate certain albuminoids which it contains. The next is the adding of lime in the form of a milk of lime or whitewash to precipitate certain impurities, yet at the same time it makes an objectionable compound with the sugar. To rid the solution of this compound it is next submitted to a carbon dioxide treatment or "carbonation." This precipitates much of the lime. This carbon dioxide is manufactured in the lime-kiln and is merely the collection of what would otherwise be waste. The idea in this treatment is not to remove all the lime but leave sufficient to keep the solution slightly alkaline. The next step is to pass the juice onto the filter press, which removes the impurities which have been precipitated by the lime treatment. However, in order to make the process more perfect, a second liming together with the second carbonatation accomplishes this result. From a mass almost black in color the solution has now become very light, though not water white by any means.

The solution is now ready for the evaporators, and contains perhaps 10 per cent of sugar. The first evaporators reduce the light colored thin juice to a forty-five or fifty per cent solution, and it is then treated to sulphur fumes in order to bleach and precipitate other impurities. This process also reduces the lime and the viscosity or stickiness of the mass. It is again filtered through a mechanical filter or what is called an inverted bag filter, when it is ready for the vacuum pans. In these it is boiled to grain. This vacuum pan makes a substance called massecuite, which is French for "boiled mass," the thick molasses with much of the impurity and perhaps 96 per cent of sugar. This is next carried to the centrifugals where a 1200 revolution per minute machine throws the syrup away from the granulated sugar, which is later washed, run through a rotary dryer and later put into the sacks, the making of which is described at the beginning of this article.

This is perhaps enough regarding this great factory which it is an inspiration to visit, and we will pass on to the Beet Growers Institute which was fathered by the management of the Experiment Station to which we have referred. At the head of this Station is Mr. Adams, and under him a corps of excellent workers along various scientific lines. Mr. Adams conceived the idea that if the growers could be brought together to discuss the problems of beet culture it would be of great value to them and to the owners of the great factory. So arrangements were made for the barbecue and institute to be held at Alisal Park a few miles from Salinas, and it must be confessed the sugar factory people, once they decide to hold an institute, hold a good one, and make it one to be remembered by the patrons of the factory. Tickets were issued over the narrow gauge railway running from Watsonville, Salinas, Spreckels and other towns, to the park which is a natural grove of sycamore, like oak, wild azaleas, California buckeyes and various other interesting and beautiful trees. The buckeyes and azaleas at this time of the year were indeed most wonderful. The happy crowd of perhaps 800 people gathered in time for the opening of the program. The first number was supplied by the Spreckels orchestra, after which Mr. Adams called the meeting to order and introduced Manager Moore of the factory. Mr. Moore being more a man of action than of words, extended a warm greeting to all who were present and then called upon Judge Lacy to extend a more formal welcome. The Judge suggested that if this or a similar day could be made a regular observance of the people of the Valley it would be not only a pleasure to the people but a good advertising feature as well. He referred to other sections having their rose day, cherry day, etc., and asked why should not beet growers honor their product? He spoke of the various kinds of beets as red beet, white beet, cow beet, heart beat, pulse beat, drum beat, and even the dead beat, but fortunately among the beet growers said the last is scarcely ever found, and closed with the hope that all would enjoy the enjoyment of this enjoyable day.

Prof. Shaw of the State University opened his address with his often repeated quotation from Josh Billings. The writer has heard it several times and has almost committed it to memory, though he has lost a few cogs, but to give something of the idea and to draw out the Professor to give us

SOUR STOCK.

Below is a view of the root system of two-year-old Florida sour stock grown in the Southland Nurseries of Mr. F. H. Disbrow, given to show what a magnificent fibrous system these roots have. Sour stock is coming more and more into general use, not only because of its excellent root system, which gives a vigorous tree, but because trees budded upon it are more resistant to gum disease. Mr. Disbrow states that in his score of years experience in growing seed bed stock he has produced over 5,000,000 seedlings, and he unqualifiedly endorses the sour stock as the best all around stock for California conditions. We doubt not that up to this time more orchards have been planted upon sweet stock than on sour, but the demand has been gradually changing, and today the greater percentage of the budding is upon sour. The seed of this stock must all be brought from Florida, and a year or more ago there was some trouble in securing sufficient, because of horticultural quarantine regulations. The state horticultural commissioner has modified the regulations so that now, under proper inspection, seed is admitted. Regarding this stock Mr. Disbrow says:

"It was introduced into Florida from Spain by the early Spaniards, and may be seen today, growing in isolated groves which receive no care whatever, healthy, clean and vigorous, on hammock land in the interior everglade regions of Southern Florida, where they were no doubt planted years ago by the Indians. Where the orange groves of Florida were destroyed by the freeze of 1894-5, killing the bud completely, sprouts from the sour root have grown up, are now bearing, and furnish the principal supply of sour seed."

ROOT SYSTEM OF SOUR STOCK.

MAGNESIA LIME.

The Cultivator received some time since a communication from Dr. Snowden answering Dr. Lipman's article in the number of June 1, and it has been unavoidably delayed until this time.

Dr. Snowden on Chlorosis.

Reviewing Dr. Lipman's article in your issue of 1st inst., discussing the causes of chlorosis, etc., the writer entertains the highest regard for the doctor's opinions in general; yet cannot afford to neglect certain facts which speak for themselves.

Ratio of Magnesia to Lime.

Accepting the results and conclusions of Dr. Oscar Loew and other investigators of the subject, it is certain that this ratio varies within wide limits, and that it also varies for different plants. I disclaim having tried to fix the most favorable ratio for any plant, although there is a mass of evidence to show that available lime should not drop below two parts to one of magnesia in the soil of the orange orchard if chlorosis is to be prevented.

This minimum ratio of lime was not adopted from the conclusions of any other investigator, since so far as I know, no one has ever heretofore studied the needs of the orange in this connection; but it is the result of fully one hundred observations made in the field and correlated with the analytical indications of the corresponding soil samples. The territory covered in this work is not confined to the Covina district, but reaches from Porterville to Santa Ana.

To show how positive the evidence has been in some instances: an orange grower submitted twelve samples for magnesia and lime determination saying his orchard was not suffering from "variegated leaf" except in one location. With no further knowledge of the case the report of the analytical indications was positively that number eight should be the chloritic location. His reply was "I will say that the most pronounced case of "variegated leaves" occurs at No. 8 where you found .38 per cent magnesia and .53 per cent lime, thus confirming your theories."

Methods of Solution.

My method requires boiling—not simply digesting, since it is necessary to eliminate the carbonic acid and also to dissolve enough iron to engage all the phosphoric acid dissolved.

Dr. Lipman's Results.

Sample No. 1. Findings.

Methods of Solution	Magnesia	Lime	Ratio
Snowden	0.42	0.51	1-1.21
Official	0.93	1.19	1-1.28
Hilgard	1.23	1.82	1-1.48

Sample No. 2. Findings.

Methods of Solution	Magnesia	Lime	Ratio
Snowden	1.02	0.64	1-0.63
Hilgard	1.68	1.82	1-1.08

In both these cases the orchards are suffering with chlorosis; in both

the lime is below the relative limit of safety fixed by me, by all the methods used. Thus Dr. Lipman's findings actually support my conclusion as far as they go. Now to make his endorsement complete I suggest that he take samples from orchard soils where the trees are thrifty and show not a trace of mottled leaf. In these I predict he will find at least twice as much lime as magnesia by my method.

The doctor points out that not the total lime, but the form of the lime is very important; and yet he favors a method that makes no distinction between the available and the unavailable, as against one that does.

Doctor Hilgard recognizes the principle of the greater activity of the soil materials soluble in weak acids, as evidenced by his practical endorsement of Dyer's 1 per cent citric acid solvent for some of the plant foods in the soil. ("Soils," page 339.)

Dr. H. W. Wiley says "Particles of lime minerals in soils are corroded only superficially by the rootlets of plants, and any process which would attack only the superficies of the lime particles would thus more nearly represent the activity of the solvent forces of plant growth." (Agricultural Analysis, Vol. 1, page 440.)

A Matter of Magnesia.

Admittedly because the ratio found by the Hilgard method is very much like that first recommended by Loew as the approximate ratio necessary between the two for plants in general, Doctor Lipman draws the conclusion that there is no justification for my conclusion, notwithstanding that it is based on much practical as well as theoretical evidence.

If we ignore the availability of the soil elements it is proper to assume that all the lime may be combined as silicate and all the magnesia as carbonate. Dr. C. G. Hopkins found in his experiments that with 0.57 per cent magnesia thus combined the plants were seriously injured. With 0.762 per cent they were usually so nearly killed as to produce no grain. While with 0.953 per cent they were practically all killed. ("Soil Fertility and Permanent Agriculture," page 170.) Now in this case where would the orange trees—not so very different from other plants in their tolerance of alkalies—"get off," with the 1.23 and 1.68 per cents of magnesia without the available antidote my method alone shows to be present?

Purpose in Using Lime.

On acid soils I always advise the carbonate, and on alkaline, the sulphate, provided the magnesia-lime ratio demands any at all. I have advised no one to use lime in any form until a chemical analysis shows that it is needed. If one does not wish to pay to have this work done he should consult his official advisers.

It is fortunate for the growers that there is one enterprising grower who was willing to use 50 tons of gypsum per acre, and I anticipate no loss to him through damage to his trees; since in '89 I was engaged to examine and report on a deposit of gypsum in Citrus County, Florida, and found orange trees growing and thriving on the deposit, which proved to be of low grade material. This orchard maintained its standing as a fine orange grove property until its career was closed by the freeze of '95.

Neither do I share with the doctor the belief that the reserve supply of potash will be made available all at once; the technical reasons for this being not desirable here. 50 tons of 92 per cent gypsum will add 0.86 per cent lime to one foot, or 0.29 per cent to three feet depth of soil on one acre.

Causes of Chlorosis.

It is generally understood that there are a number of causes of chlorosis. Let me add to the doctor's list lack of magnesia. Nevertheless, I feel sure that he will find upon impartial investigation that relative excess of magnesia is by far the most potent and wide-spread one in Southern California. I have seen several of those cases where it is due to too much lime; but to an experienced observer it is possible to tell the difference between these two forms upon simple inspection. That produced by too much lime is a more solid yellow, the rationale of this difference being simple enough. The trees are always planted in the limy soil at the time of

A New Book and a Good One

The Story of the Soil

By Cyril G. Hopkins

"A love tale threading a substantial fabric of important facts about the soil"

I must say that I think the book is destined to do more good, stir more thought, encourage more upward effort among the farmers of this country than any other publication that has yet appeared. It was a happy thought making a human story of it.—Ex-Governor W. D. Hoard, Ex-President Board of Regents, University of Wisconsin, Editor of Hoard's Dairyman, Fort Atkinson, Wisconsin.

I enjoyed every word of it. It is fascinating. I doubt if a dozen people in the country would believe that it is possible to write a novel about the soil—these big soil problems handled so ably, so plainly that any farmer can understand. Here is a book that certainly every man in the land should read.—Editor Charles W. Burkett, of American Agriculturist and of Ginn & Company's Country Life Education Series, Boston, Mass.

This book is the greatest work of fiction based on agriculture ever written. The narrative contains a storehouse of information that will be worth millions to the farmers of America. Read this story; it is worth its weight in gold.—Burridge D. Butler, Publisher of the Prairie Farmer, Chicago, Illinois.

12 mo. 350 pages, handsomely printed with clear type on heavy wove white paper, well illustrated, strongly and durably bound. We offer this book, postpaid, in connection with 1 year's subscription to the California Cultivator, for $2.35. Book alone, $1.50.

Deciduous Fruit Culture

THE CALIFORNIA PEACH TREE BORER.

By Dudley Moulton, Deputy State Commissioner of Horticulture.

The California peach tree borer has been a menace to fruit growers in Santa Clara, San Mateo and Alameda Counties from the very beginning of the fruit industry in these regions and now the large acreage of apricots, peaches and prunes offers the insects suitable food plants over a large area and under almost ideal conditions in which to live. The pest is becoming ever more serious especially in the newer fruit sections and there are constant inquiries directed toward better understanding of the insect itself and the best methods of controlling it. Orchardists seldom recognize the adult moth of the species although the constant care and the disagreeable labor which accompanies digging the borers out has caused them to become intimately well acquainted with the larval stages.

The California peach tree borer derives its common name from its close relationship to the Eastern peach tree borer and from the fact that it is primarily a pest of peach and closely related trees. The Eastern borer has been known in the eastern states for more than 200 years. The Western borer has been known only since our own fruit industry was started and it is considered a pest only in limited areas around the southern arm of the San Francisco Bay. Adult moths of the species have been collected by entomologists in Northern California, Oregon, Washington, Nevada and Colorado, and the insect is seen to be a native of all of the western coast states.

At one time the lower foothill regions in the western part of the Santa Clara Valley were covered with a dense growth of underbrush and the Western Choke Cherry, one of the native food plants of the species, was one of the common plants. This land was cleared and set into orchards and the cultivated varieties of peaches, apricots and prunes gradually displaced the other foodplants of the insect and in its own native habitat. It was natural for the insect, therefore, to adapt itself to these new and similar foodplants and to extend its habitat into the orchards in the open and adjoining country.

Root Boring Insect.

The peach tree borer is eminently a root boring insect and two factors, the root stocks upon which the trees are grafted and the nature of the soil, influence largely the amount of damage that borers will inflict. Peach and apricot stocks are most susceptible to attack; almond, cherry, apple and plums less so and the wild plum, known as the Myrobolan or cherry plum (Prunus cerasifera) is almost entirely resistant. Myrobolan plum seedlings are imported in great quantities from Europe and are now recognized as one of the best stocks upon which to graft the domestic plums. This stock is susceptible to severe attack only when a tree has been weakened by some other cause such as a lack of water, cultivation or when it has been partly killed by gophers or other rodents. Almond stocks are more or less resistant if they are planted in soils suitable to their growth. Borers seem to attack trees more readily when they are planted in soils of light sand or gravel texture. We do not think that newly hatched larvae can reach the lower crowns or roots any more easily in light than in the heavier soils but it appears rather that the trees themselves are not so strong and therefore not so resistant.

The life cycle of the borer extends over a period of about twelve months. Larvae of all sizes may be found at almost any time during the year because one brood overlaps the other, but there is a definite period during which adult moths are flying, oviposition is taking place and when the newly hatched larvae are entering the trees. These periods are important economically because they indicate when is the proper time to apply protective washes. Adult moths are steel blue in color, are very active and are often mistaken for wasps because of their similar appearance and their rapid and erratic movements during flight. The first individuals of the season appear during April, many more in May and June and they are flying in maximum numbers during July and August. A few last individuals appear during September. They mate immediately after issuing from their cocoons and begin to oviposit a few hours later. The life of any individual moth averages only four or five days. Eggs are usually placed on the lower trunks of the trees between four and ten inches from the ground and they are easily found after they have once been seen. They are about one thirty-second of an inch long, are flattened and depressed on two sides, and at one end and are chestnut to dark brown in color. The eggs hatch about two weeks after they have been placed.

Larvae Are Active.

The minute larvae are extremely active, they crawl about freely and try at once to hide or get below the surface of the ground where they are more or less protected. They burrow into the living bark within a couple of hours after hatching, and later we recognize them as the borers in our trees. The nature and seriousness of their injury is recognized by every practical orchardist. Larvae usually mature to moths about 11 months after they have hatched. The chrysalis stage, the changing from larva to the adult moth, occurs during the spring and summer months and after the moths emerge the empty pupal cases are commonly seen projecting out from the cracked and wounded bark.

The period when new larvae are entering the trees and the second period when they are mostly full grown are important to the orchardist because the too commonly practiced methods of control, "worming" and applying protective washes, are successful more or less as they are practiced at the proper time. Eggs are placed two or three days after the moth first emerges, which means that the period of oviposition is practically the same as that of the appearance of the moths. The eggs hatch after about two weeks and as the worms enter the trees immediately this occurs mostly (judging from our records of emergence of moths), from the middle of June to the middle of October and the period when they are entering in maximum numbers is from the middle of July to the middle of September Protective washes should be applied just before this time preferably during the month of May. All larvae are from one-half to nearly full grown and are more or less sluggish during the winter months and this is preferably the period when worming should be done. Worming during the spring is also quite as effective but the larvae, becoming active in February and March, when the sap begins to flow up, can do much damage. Worming earlier in the winter would eliminate this later injury.

Only sharp tools should be used during the process of worming. The practice of using a combined knife, scraper and chisel, such an instrument as is sold for this particular purpose, is not advisable because such tools are made of poorly tempered steel and cannot be kept sharpened. An ordinary ¾-inch wood chisel, a horseshoe knife, and an individual scraper are now commonly considered the best tools. The bark is too often broken rather than cut when dull tools are used and much damage accompanies such careless work. The bark around the wound should be cut clean so that it can heal over.

Protective Wash.

A protective wash should be used after worming has been accomplished. Such a wash serves in two ways. Primarily it acts as a repellent and keeps moths from placing their eggs

on these treated surfaces. If the wash is applied after worming in the fall it deteriorates and cracks and falls away before the time when oviposition is occurring and for this reason is not so effective. It is considered good practice to dig the borers in the winter but the wash should be applied in April or May. The wash serves in a secondary way to render the labor of subsequent worming much more easy and rapid. The dirt and bark scalings fall from the tree more easily and the masses of trash, which indicate the presence of borers, are better defined.

A mixture of lime and crude oil has been successfully used and its cheapness and the ease with which it is prepared render it most desirable. About 50 pounds of rock lime are placed in a barrel and slaked with 10 to 15 gallons of warm water and while the lime is boiling 6 or 8 gallons of heavy crude oil are poured slowly in. Enough water is then added to make the whole into a thick wash. This should be applied immediately and preferably with a heavy brush. The roots exposed after worming and the lower trunk up to about 18 inches above the ground should be thoroughly treated.

Pure heavy crude oil has been much used for borers but this treatment is dangerous, especially on peach and apricot trees. A heavy residuum oil has resulted in less injury but even this should not be generally recommended. The lime-oil mixture contains the necessary repellent qualities of the crude oil and the porousness of the lime which renders it safe. Carbon bisulphide has been recommended extensively but its use is now generally discouraged. If the treatment should be followed by a rain, or if the ground is especially damp the gas treated soil cannot be left around the trees without immediate injury. The carbon bisulphide method has been most successful when an orchardist has done his own work for several years and when he himself places the charge and realizes the danger. Hand cutting and removing the dead bark is not generally practiced with this treatment and consequently the tree can never heal over the old wound. Common practice has demonstrated that it is necessary to dig the worms out by hand, preferably in the early winter or spring and that a protective wash is desirable and the lime-oil wash applied in April and May has been as successful as any.

NITROGEN GATHERING BACTERIA APPLIED THROUGH MANURE.

Two conflicting statements appeared in a recent Cultivator and called for a criticism and a query from observing subscribers. The statement in an article by Mrs. Sherman was in effect that the application of manure from alfalfa-fed animals carried to the soil nitrogen gathering bacteria. The other statement on another page was that alfalfa hay or manure would not inoculate soil.

Determined that our keen-eyed subscriber should be informed we wrote to Prof. C. B. Lipman of the University of California for light. In a sense both statements are correct. But without preliminary statements we ask the careful reading of Prof. Lipman's letter. It is a most informing statement on a question which perplexes many.

* * * *

I note your question with reference to the bacteria of legumes which may be caried through the manure as a medium to the soil. In answer to this, I beg to say that though there can be no doubt at all that some of the legume bacteria pass through the alimentary tract of animals with the alfalfa material, it is altogether very doubtful that sufficient of them and especially sufficient virulent forms do so and, therefore, I should regard that means of inoculating the soil a very precarious one where inoculation was actually necessary. To be sure, barnyard manures are usually made in places where a good deal of alfalfa material, never fed to the cattle at all, becomes mixed with the manure and in that way the manure is often responsible for carrying the legume bacteria of the alfalfa plant. There is much more certainty of the bacteria being present by this means than by the first above mentioned, but even here I should say that it is a doubtful means of inoculating the soil. The only safe way, as I have often indicated in my talks in California, to inoculate the alfalfa, is to go to the direct source of growth of the bacteria, namely, either to a soil containing them or to an artificial culture. As I have explained, the method which can be used here in California by making a suspension of an inoculated soil in clean water and moistening the seed, thus covering every seed with a film of water containing many of the legume bacteria, it can be easily seen that the method is a simple one which can be carried out by anybody and with no special precautions and no expense can be made to give the most effective service. Of course, it may also be argued that in many cases inoculation is unnecessary in California, as indeed I have pointed out in all of my talks on this subject, because of the fact that there are so many wild legumes growing throughout the state which seem to be more or less closely related to alfalfa, or, at least, the bacteria on their roots are, to those on the alfalfa roots, but that is really not an argument to controvert in any way the statements above made with reference to inoculation by means of manure, because it is a question of need of inoculation or no need of it and in the first case it can only be done by the proper method if good results are expected. In the second case, since no inoculation is necessary, there is also no necessity for going to the labor and expense of inoculation by means whose efficacy is questionable.

As you say in your letter, I have often talked of the beneficial effects of manure in soils, aside from all other ways, through the large number of bacteria which the manure introduces into the soil and it may be that this statement has somewhat confused the question, which I have above discussed with other bacteriological conditions in the soil, in the minds of some of my hearers or readers. The fact is that while this enormous number of bacteria is introduced into the soil by means of manure, they are not the bacteria for the most part that have anything to do with nitrogen fixation, either by means of a partnership with legumes or by powers which they possess by living free in the soil. They are for the most part, bacteria which are concerned in the transformation of organic nitrogen compounds to ammonia and to a considerable extent also bacteria of the nitrifying group which have the power of changing that ammonia to nitrates. I am making this distinction in order that the matter may be perfectly clear in the minds of all those who have any doubts with reference to this matter. The introduction of any but the nitrogen fixing bacteria has thus far not been looked upon as true inoculation, and while, to be sure, in a broader sense it is so, is not regarded as such because of the fact that the soil naturally contains such large numbers of these bacteria that an introduction of a few nitrifying bacteria usually is of no effect so far as the production of nitrates is concerned.

The directors of the Chamber of Commerce of Fresno are endorsing the work of squirrel eradication and urge the joining of the county with the federal and state authorities in the effort.

The San Joaquin Valley has watched with interest the first trip of the ship J. R. McDonald up the San Joaquin river to within hauling distance of Fresno.

A suit is on between the Consolidated Seeded Raisin Company and the Selma Fruit Company involving $100,000 property interests.

Raisin growers have information from the raisin producing sections of Australia that they will make no exports of raisins this year.

Tulare County's Valencias have all been shipped and with satisfactory prices to the growers.

The alfalfa crop at Fort Romie, Monterey County, is showing up remarkably fine.

The Pump at the Bottom is what counts.

A vertical centrifugal pump must be built to last. It is out of sight when working, frequently submerged in water, goes without inspection for months and always gets the blame no matter what happens.

DOW

Vertical Centrifugal Pumps

are built to stand the racket. Stuffing boxes and glands are enclosed. The runner is grit proof and there are no complicated balancing devices to get out of order.

That is why

DOW

Vertical pumps

have long life and high efficiency. That is why their efficiency does not fall off after a few months' use.

Did you get a copy of

AGRICULTURAL PUMPS?

Yours for the asking.

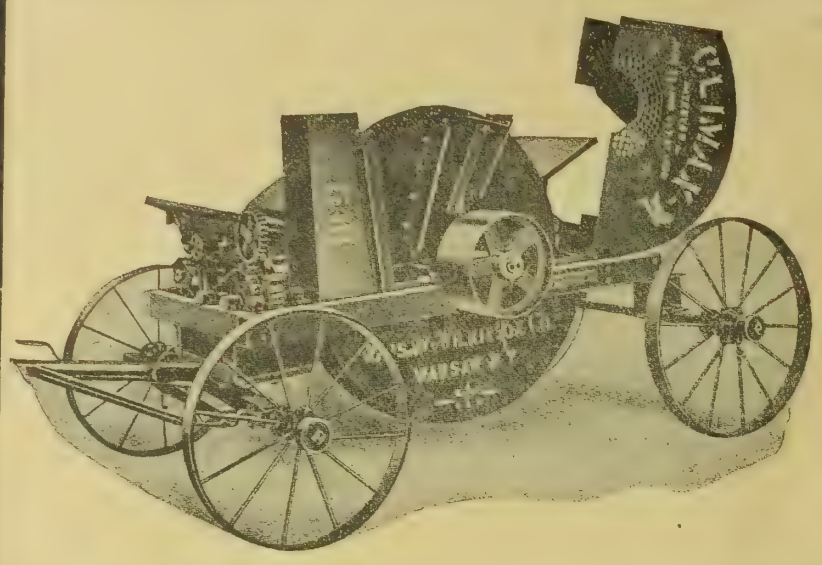
Climax Ensilage Cutters



In the Climax Pneumatic Ensilage Cutter both the cutting and elevating are done by a large wheel which carries the knives on one side and the elevating fans on the other. Both the cutting and elevating, therefore, are done at one operation, in much simpler manner and with an expenditure of much less power than in those machines where the elevating device is a fan attachment added to the cutter.

The convenience of having an ensilage cutter of large capacity on its own road wheels is obvious. We confidently assert that no other ensilage cutter is so easy to work and easy to move and set up as ours, or has such large capacity for power used. They are unequaled in simplicity, strength, durability, convenience and safety in operation, and the excellent quality and uniformity of the silage. We received at the

St. Louis Fair the Only Award

for ensilage cutter of the side-wheel type, 5 to 50 tons of green corn per hour, where cut in one-half lengths, other feed in proportion. For further particulars, call on or address

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

THE MILK INSPECTOR.

We will later have a story of milk inspection as carried on in Santa Barbara County. It is not pleasing. It may be interesting. Meantime the following from the Rural New Yorker may be of interest and show to the California dairyman that he is not the only one who has troubles.

Inspection by the New York City Board of Health is probably in a somewhat chaotic condition. So far as farmers are concerned there is no certainty of a more rational inspection. In former years there has been a veterinary inspection, carried out by the creamery people, the expense sometimes thrown upon the farmers and sometimes borne by the creamery. Now a veterinarian is sent out from the city. He has been in this vicinity, and the report is that he has ruled out some cows. I have heard no complaint, and have seen no particular evidence either of competency or incompetency. The value of the veterinary inspection is still partially unsettled, but with little reason at present to doubt its efficiency to a tolerable degree. Very likely the veterinarian has had very little experience with cows, as he is supposed to be a city man, and dislikes cows. He appears to be a better man than was expected, but not so good as is needed. This estimate is founded partially on a reasonably good guess.

It has been understood that a bacteriological test is to be made of milk as sold by the farmer, and some have supposed that no other inspections would be made than these two. This illusion has been dispelled within a day or two. Perhaps I may as well give somewhat in detail the mode of procedure in this case. Two men were seen approaching, driving quite rapidly, just as the farmer was about starting for the field in the afternoon. He halted a little for the men to drive up and one of them, a very large man with a very red face and a rough bearing, remarked that he wanted to see the cow stable. He neither asked permission to do so, nor did he announce his identity or authority. Finally the farmer recovered himself enough to ask the purpose of the visit.

"The Health Department," responded the caller.

"The New York City Department?" queried the farmer. A nod answered the question.

"A veterinarian?" further asked the farmer.

"Nope; inspector." The inspector then proceeded to the stable, asked several questions and wrote rapidly, taking in all he got from one spot near the corner of the barn. "Sign there," suggested the inspector. The farmer thought he ought to see what he was expected to sign. The inspector said he would sign for him. The farmer still insisted that he wanted to see what was on the paper. The inspector wrote something, tore out the carbon duplicate and handed it to the farmer. The score was 70. This was neither a liberal score nor an extremely bad one. The farmer asked the inspector if he couldn't allow something for the concrete floor. Six points had been taken off for the floor. The inspector said he hadn't seen that any part of the floor was concrete, but as over half the floor had been concreted he would allow one point. This he did not do, however. The farmer further asked if he might not have any credit for the small-topped milk pails he was using.

"We'll see 'em," remarked the inspector.

"In what respect do you find the privy unsanitary?"

"Has it wash-down bowls?" "No." "Has it covers with spring hinges?" "No." "Then it is unsanitary." "It has covers, is taken care of and is in good shape." "Has it spring hinges on the covers?" "No." "Then it is unsanitary," again announced the inspector.

"By the way, I gave you credit for tight ceiling. I see there is some dust coming down from the hay mow. I will take off something for that."

There was a short argument which ended by the inspector saying that he was satisfied with the score in the first place, but, he added:

"I thought while you are caviling at my inspection, I would show you that I could rip this thing up, if I am a mind to." The remarks of the inspector were all in an angry tone, and he now slammed his book down to emphasize apparently, his own importance and his disgust at the farmer's question or impertinence, or as he seemed to think, caviling. Webster says "cavil" means to raise captious or frivolous objections; to find fault without good reason. The farmer had answered the inspector's questions courteously. He had asked about four points, but not in an angry or captious mood. He scarcely received a single courteous answer. He wasn't bluffed into submission, however, and further asked:

"What is it expected that a stable should score?"

"Whatever it does score "

"But what should a stable score?"

"One hundred is perfect, sir," was the answer.

"You do not mean me to understand that you expect a stable to score a hundred?"

"It is impossible, sir. The best we ever had was 92."

"Hasn't the Board of Health some standard upon which they pass a stable?"

"It makes no difference if the stable scores but 10, nothing will be done about it. All we want is to educate the farmers to do a little better."

There were some further remarks by the farmer about the pleasant day, which were answered in a sarcastic manner. Possibly it was less the fault of the inspector that he was thus uncivil than the bad beer he had recently "punished." Nevertheless he evidently went to the stable with a "chip on his shoulder," not an especially good thing for an inspector to have in his possession anyway. "I can rip this thing up," and "we want to educate the farmers to do a little better." That first quotation is a very good comment on the arguments of those who claim that scores made by different inspectors are practically uniform. Regarding the second it seems as though this particular inspector must be a great "educator." Former inspectors have been bad enough, as the Board of Health has publicly admitted, although there seem to have been some fairly good ones among them. This last specimen has little to his credit I am sure, judging from good evidence that is submitted. We now wait for the third "installment," which is supposed to be the "bug" man with plates and things to catch the bacteria that may or may not be in the milk the farmer sells. When and where shall we look for common sense regarding this business.

H. H. L.

COW TESTING ASSOCIATIONS.

In Denmark there are 500 cow testing associations; in Sweden as many more, and in Norway and other countries of Europe several hundred. There were 170 in Denmark within five years after they first started. In the United States there were only twenty-nine of these associations at the end of five years. In Canada about sixty cow testing associations have been formed. In the United States there are in all fifty-six such associations, located as follows: Wisconsin, eleven, Vermont, nine; Maine, seven; Michigan, six; Iowa, five; California and Ohio, three each; Pennsylvania and New York, two each; and Washington, Connecticut, Colorado, Nebraska, New Hamp-

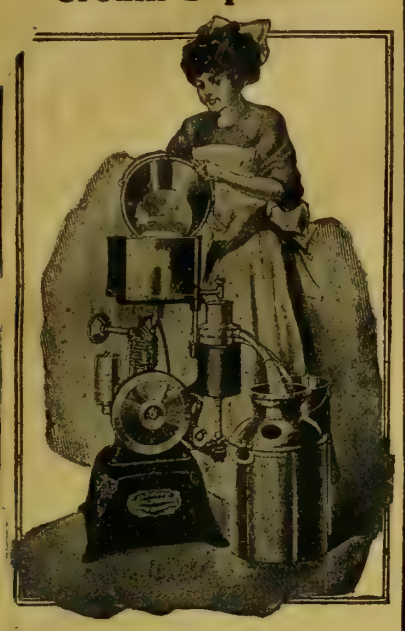
AUTOMATIC
Cream Separator



CRANKLESS
and GEARLESS

Nothing like it has ever before been invented. One size machine for any size dairy. The drudgery of dairying now a thing of the past.

It separates the milk perfectly faster than ten men can milk it.

Start the separator when the milking begins and it being both automatic and continuous in its operation, when the farmer is through milking he is through skimming.

Speed of bowl brought up in 15 seconds and will run for hours without the slightest variation.

It is destined to revolutionize the dairy business.

We are at least FIVE YEARS ahead of all competitors.

The above statement is drawn from a statement made by Prof. E. S. Savage of Cornell University. The reason for the slowness of development of these associations in the United States, he thinks, is the great lack of energetic local leadership among our dairy farmers.

We may say that the reason for the great lack of such leadership is the lack of dairy intelligence among the great mass of dairy farmers.

A glance at the number found in each of the above states shows that Wisconsin has the largest number. There is no state in the Union where all phases of the dairy question are kept so constantly agitated and before the eyes of the farmer as in Wisconsin. Besides, it has a vigorous state dairymens association, which has taken the lead in pushing this industry upon the conviction of the farmers of the state. Professor Savage is right. It takes leadership to get anything done.—Hoard's.

DAIRYING SCORE CARD.

The following detailed score card to apply to equipment and methods of the dairy, we clip from Hoard's Dairyman:

Equipment	Score Perfect
Cows.	
Health	6
Apparently in good health	1
If tested with tuberculin once a year and no tuberculosis is found, or if tested once in six months and all reacting animals removed	5
(If tested only once a year and reacting animals found and removed, 2.)

ANIMAL HAPPINESS ON THE FARM.

The dairyman who is looking for results will not allow the dog or the small boy to worry his cows. He knows that if he wants a well filled pail they must not be frightened, but kept quiet and content.

The grower of beef cattle is sure to weed out the one that is continually bawling when it should be grazing, for the simple reason that there is more waste than gain of adipose tissue at such a time. The stock content to feed upon the good pasture at hand, rather than busy themselves trying to break into forbidden fields, possibly not nearly as good, are the ones that make the most gain in weight.

The hen that is dogged every time she finds a nice soft place to scratch is not the one that makes the best egg record. She may be hard on the garden, but a good fence would easily fix that. Do not discourage her natural efforts and then expect her to do her best for you.

The horse that is compelled to fight flies continually cannot get in a full day's work, or at least if it does there is less in stamina, which eventually tells on the life work of the animal. Neither can it do its best with an ill fitting harness. The horse that is comfortable and in good spirits is the one which makes the record.

A flock of sheep harassed by dogs soon show the trouble in their general condition as surely as in their manner. Fleetness of foot is not one of the characteristics of the animal, and when this is enforced as a means of preservation it is to the detriment of the flock.

The farmer and his family, as well as his stock, accomplish more when care free and in a happy turn of mind. All nature is fresh and cheerful. It is profitable for us to be likewise.—Farm World.

It is a known fact among most buyers that one of the reasons they do not buy eggs on the quality basis is because the producer objects to it, refusing to accept any price other than so much per dozen, regardless of quality. Sometimes the farmer even threatens to go to another buyer, if his eggs are candled. This is indeed a very peculiar state of affairs. Some farmers will not sell their best eggs because they do not obtain any better prices for them. Some do not know what a really first-class egg is like, so through ignorance market only a fair quality of eggs. Some blame must also be placed upon the farmer who brings in his best eggs. In many cases he will not demand a grading of his eggs. In fact, he will sometimes resent any hint on the part of the buyer to candle his eggs.

Several cases have been reported where hydrocyanic acid gas was used for fumigating hen houses. The trouble is to make such houses airtight. They are usually ventilated. The poisonous gas is very active, and the house must be perfectly tight in order to make this method effective. If there are any cracks the gas will escape rapidly.

It is hopeless to advise dairy farmers who are opposed to silos, dairy papers and things that cost a little time and money.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.

No Hoof-No Horse

Statistics show that 80 per cent of all horses are lame, and that 80 per cent of the lameness is caused by hard and contracted feet. Especially is the dry season in this section very hard on hoofs. As a hoof softener, toughener, nourisher and grower there is nothing equal to

Eshelman's Wool Fat Hoof Healer

A horse's hoof is from 60 to 70 per cent water. Grease and water will not mix. There is no grease about Wool Fat. It mixes readily with water, is very penetrating, and while a great medicine of itself, it also acts as a vehicle to carry to the afflicted parts the other medicinal properties of the HEALER. It gives natural stimulation and nourishment to the hoof. There is nothing that can compare with it for this purpose, nor as a remedy for tender, brittle, hard and contracted hoofs, split hoofs, quarter cracks, mud fever, scratches, corns, cracked heels, grease heels, and for all kinds of sores and cuts anywhere on any stock. It will surprise you with its power as a healer and restorer. It is not a new remedy, but has been on the market in the East for many years, where it has given the greatest satisfaction.

4 oz. package, 25c; 12 oz., 50c; 32 oz., $1.00; 5 lb. pail, $2.00; 10 lb. pail, $3.50. It is easy of application. Send for Folder with many testimonials of big horsemen, vets and others. Or better accept our

TRIAL OFFER.

We will send you a 2 lb. can; use it 15 days, and if satisfactory send us $1.00. If not, write us to that effect, and you need pay nothing. We take all the risk; you just try it. Send for it today.

Small Fruits and Vegetables

STRAWBERRIES OUT OF SEASON.

By Q. A. Lobingier.

Answering a question as to method of producing a second or other crop of strawberries out of season, Mr. Lobingier writes:

You never can tell just what results you will have from strawberries. You cannot tell just what any particular variety will do on your soil until you try it. And a variety will not act just the same way every year. So many things enter into the problem that it is folly to lay down any set rule for producing certain results. Some years ago the growers at Montebello were very successful in getting a first-class crop of Brandywines in November. They allowed the plants to ripen up and rest by withholding water. This was done to such an extent that to the casual observer it would seem that the plants were dead. In fact, all the old leaves were dried up, but along in September they were freely watered and made a wonderful growth and set a large crop of fine berries, which at that late season brought fancy prices. But Montebello is very free from frost and that particular fall was free from rain which was greatly in their favor. The success of one or two growers that particular season prompted all of them the following season to repeat the experiment with the result the same as to growth and crop, but the rains came early and destroyed the fruit. With the low temperature prevailing at that season the fruit will not stand up under a rain.

It is something I have not known to be satisfactorily explained why certain varieties that in the East are known to produce but one crop, will when planted out here bear the entire season, and why but few will do this. I had some thirty varieties shipped to me from the East one season and gave them an equal, impartial test, side by side, under exactly similar conditions. The Excelsior and Brandywine were the only two out of the lot that bore more than the one crop, and the Excelsior limit was reached in eight or nine weeks, while the Brandywine bore the entire season.

I set out an acre of Brandywines in November and we marketed the first fruit on the 29th of March and picked from this acre every day until the 15th of July when the plants ceased bearing, but were given regular waterings until fall and made a fine growth. The following season we marketed the first berries April 4th and picked every day until Oct. 12th—that year's berries from that acre selling for $2700. The following year we began picking from that acre on April 12th and picked every day until Dec. 4th. As we did not keep any separate record of this year's picking, the figures cannot be given, but while there was about the same quantity of fruit as the previous year, the price was very much lower and the returns correspondingly less. The following year we began picking from this same piece April 1st and continued until July 1st when the crop was so poor as not to justify watering, and they were plowed under.

Since then the Klondike has come to the front as an early, and in a sense, continuous bearer, but its limit here is a couple of months.

I no longer grow strawberries for market, but if I did, and wished to get a second crop I would not hesitate to try the method of withholding water until they could have a period of rest. Then by watering freely and starting new growth you would be pretty certain to get more or less berries. This method of giving the plants a rest at will could not be practiced except in a climate without summer rain.—Q. A. L.

CLOTH SHADE FOR LETTUCE.

In a recent number of one of the farm papers Mrs. C. W. Beyer describes a method of growing lettuce which is well worth trying. Her method is as follows:

"Lettuce sown in the open will mature from two to three weeks earlier and be in much finer condition if grown under cloth frame. Surround the bed by boards about six inches high set on edge. On these put a light frame made the size of the bed, and over the frame tack muslin or burlap.

"Keep the cloth over the bed all the time, and you will be surprised how much the lettuce will be in advance of that left exposed, and it is as crisp and tender as the hothouse plants.

"The same plan is good for growing lettuce in midsummer, as the cloth protects it from the sun and also helps to hold the moisture. I have found this plan excellent."

We have used the cloth protection in the fall after hard frosts have commenced, and found that the finest kind of lettuce may be grown in this way. We are trying this plan for our lettuce this spring, and anticipate the best results.

We make frames of one inch by two inch lumber, three feet by six in size, and tack cheap sheeting on this. These we use to shade newly transplanted plants in the cold frame, and also to protect them from frost on cold nights. Anyone having a hotbed or cold frame will find a few of these cloth frames very useful, although they are inexpensive. — Wisconsin Agriculturist.

SWEETS IN MERCED COUNTY.

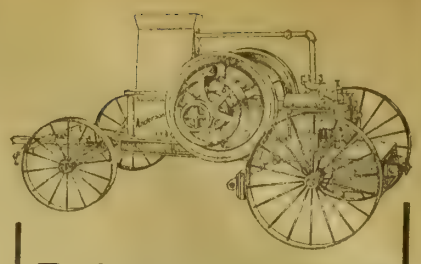
A subscriber at Atwater writes: Farmers in this district of Merced County have put in a larger area of sweet potatoes this season than ever before. The successful yields and high prices of the past few years have given a great impetus to sweet potato growing. The acreage in other districts of the state, where sweets are successfully grown, is considerably below the average this year and Merced growers anticipate unusually good prices in consequence. Three-fourths of the sweet potatoes of the state are produced in the Merced sandy loam soil and they are widely known for their peculiarly rich meaty flavor.

The success of sweet potato growers in the Atwater district is attracting many settlers, most of whom are purchasing land in Merced Colony No. 2, a tract of 3000 acres recently opened near Atwater. The Co-operative Land and Trust Company of San Francisco, the owners of the land, report a brisk demand for their property.

The Pasadena Gardeners Association, one of the live organizations of its kind in the state, not content with its annual Flower Show which is a society feature in that beautiful city, and its semi-monthly meetings on the 1st and 3rd Friday of each month, has now entered the educational field and will hold an exhibition at the Board of Trade rooms, Pasadena, on June 29th, for the purpose of educating people in nomenclature of flowers. As Mr. Barnhart of that association has remarked, many of the flowers which are becoming common in California are unknown even to some florists and gardeners. His idea is that these people should be educated, but primarily the object is to reach and enthuse the people who are not working with flowers all the time. There is to be no admission charged; there will be no prizes given, and a request is extended to all who have new plants and flowers to bring them for exhibition, and especially is the invitation to those who have flowers of which they do not know the names, to bring them for naming.

Where land is limited, cucumbers and tomatoes may be grown on stakes or trellises. Chicken-wire is good for this, or tomatoes may be tied to stakes driven in the ground at each plant, and then all but two or three branches kept cut off, and tying those left to the stake as they grow; this results in a little less fruit per plant, but more plants may be planted on the same amount of space. Three feet apart each way is enough.

Seven cars of lima beans aggregating 140 tons were shipped from Hueneme last Saturday.



PORTABLE Distillate Engines

Our well known and popular
Lambert Engines
mounted on a substantial steel truck with Friction Clutch Pulley, Magneto Sparker and Improved Cooling Device.

An exceptionally well balanced outfit that runs with practically **no vibration** and will give entire satisfaction for years.

Built in four sizes—9, 15, 20 and 25 H. P. The price is so low you cannot afford to be without one. Write today and secure one from stock.

General Agriculture

SACCHARIN TABOOED.

The secretary of agriculture has issued a decision based upon a finding of the Referee Board of Consulting Scientific Experts, which forbids the use of saccharin in food on and after July 1st next. The decision is under the Food and Drugs Act and will prohibit the manufacture or sale in the District of Columbia of the territories of foodstuffs containing saccharin, as well as interstate commerce in such foodstuffs. The finding of the board is the second since its creation and is regarded as very sweeping, inasmuch as the decision affects more than 30 different classes of foods. Some of the articles affected are soft drinks, sweet pickles, jellies and jams, and in some instances beer.

The decision as promulgated is signed by the secretary of the treasury, the secretary of agriculture, and the secretary of commerce and labor, in order that the regulations embodied in the decision may be put into effect. The decision follows:

"At the request of the secretary of agriculture, the Referee Board of Consulting Scientific Experts has conducted an investigation as to the effect on health of the use of saccharin. The investigation has been concluded, and the Referee Board reports that the continued use of saccharin for a long time in quantities over three-fourths of a gram per day is liable to impair digestion; and that the addition of saccharin as a substitute for cane sugar or other forms of sugar reduces the food value of the sweetened product and hence lowers its quality.

"Saccharin has been used as a substitute for sugar in over 30 classes of foods in which sugar is commonly recognized as a normal and valuable ingredient. If the use of saccharin be continued it is evident that amounts of saccharin may readily be consumed which will, through continual use, produce digestive disturbances. In every food in which saccharin is used, some other sweetening agent known to be harmless to health can be substituted, and there is not even a pretense that saccharin is a necessity in the manufacture of food products. Under the Food and Drugs Act articles of food are adulterated if they contain added poisonous or other added deleterious ingredients which may render them injurious to health. Articles of food are also adulterated within the meaning of the act, if substances have been mixed and packed with the foods so as to reduce or lower or injuriously affect their quality or strength. The findings of the Referee Board show that saccharin in food is such an added poisonous or other added deleterious ingredient as is contemplated by the act, and also that the substitution of saccharin for sugar in foods reduces and lowers their quality.

"The secretary of agriculture, therefore, will regard as adulterated under the Food and Drugs Act foods containing saccharin which, on and after July 1, 1911, are manufactured or offered for sale in the District of Columbia or other territories, or shipped in interstate or foreign commerce, or offered for importation into the United States."

SUGAR CONSUMPTION.

The consumption of sugar in the United States per capita went up 20 pounds in the decade between 1899 and 1909. This increase was more than twice as much as in the previous ten years. Every person in the United States now eats 79 pounds, as against 39 in 1879, or 40 pounds apiece more in the year. The growth of sugar consumption is largely due to the establishment of the domestic production of beet sugar. In 1879 only 1400 tons were produced, but in 1909 the amount had developed to 501,700, compared with 334,100 tons of home produced cane sugar in 1909 as against 89,400 tons of cane produced sugar forty years ago.

Beet Sugar.

Beet sugar constitutes, at this time, a large proportion of the total sugar production of the world. Its manufacture in the United States is comparatively new, as it had scarcely emerged from the experimental stage prior to 1880.

The number of establishments engaged in the manufacture of beet sugar increased during the decade 117 per cent; the number of acres planted in beets increased 207 per cent; the quantity of beets produced 399 per cent, and the average production per acre 61 per cent.

The value of the products increased 557 per cent. The quantity of granulated sugar increased from 37,900 tons to 496,800 tons and the value from $5,581,000 to $45,646,000. Raw sugar sold as such decreased in quantity, which indicates that the manufacturers are now refining a larger percentage of their sugar output than previously.—Orange County Tribune.

A CITY AND COUNTY LAW.

The new county horticultural act, known as the Cogswell Bill No. 965, and which was signed by the governor March 25, contains a provision that will permit San Francisco county to secure a horticultural commissioner. The clause was inserted at the request of the nurserymen and florists of San Francisco, who have been unable heretofore to secure the inspection of their orders going out from the city.

The old law provides as follows: "Whenever a petition is presented to the board of supervisors of any county, and signed by twenty-five or more persons, each of whom is a resident freeholder and possessor of an orchard, the supervisors shall appoint a horticultural commissioner." After the word county above, add "or county and city," and after orchard add "or greenhouse or nursery," and you will have the law as amended, and which now permits San Francisco to establish the office of horticultural commissioner. This county has no orchards and could not qualify under the plain reading of the old act. As amended the measure now permits florists and nurserymen of any county to join in petitioning for a commission.

A wild story was circulated all over the state while the Cogswell bill was pending that it would throw out of office all the county horticultural commissioners appointed under the law of 1909. It does nothing of the kind, and such a result was never thought of by the committee of growers drawing the bill. Most all of the commissioners understand that their tenure is not affected in any way, and that they will remain in office for the full term of four years from the date of appointment.—J. W. Jeffrey in L. A. Times.

BORAX IN THE UNITED STATES.

California produces all the borax mined in the United States and is now supplying nearly all the domestic demand. The principal mine is in the Death Valley region, in Inyo county. Another mine is in Los Angeles county.

The mineral mined is colemanite, or borax of lime, most of which is shipped crude to Alameda, Cal., or Bayonne, N. J., for refining.

About half the product is consumed in enameling kitchen ware, but new uses for borax are found every year.

Paris green is never dissolved in water but only mechanically mixed with it and held in suspension. Arsenate of lead does dissolve in water and the particles of the arsenical compound are very finely divided and much more completely cover the surfaces to be coated with the poison than is possible with paris green. The arsenate of lead sticks better and does not injure the foliage so easily. In the end it is the cheaper and better insecticide.

The management of the sugar factory at Spreckels, Monterey County, gave a barbecue picnic to 800 or more of its patrons at Alisal Park northeast of Salinas last week.

"Beats 'Em All for Making Money"

"I have run..... and many other machines, but the Wolverine beats them all for making money. I have put 216 pounds of dry straw in a bale and 175 pounds of hay." (Abstract from letter received. Name and address of party furnished on request.)

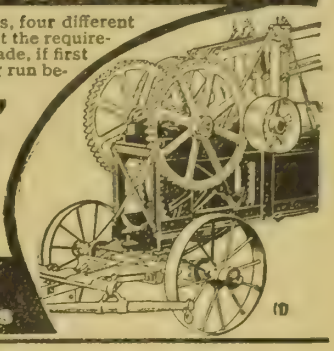
From "stem to stern" the Wolverine Hay Press is RIGHT. There isn't a dishonest or careless spot in its whole make-up. We have the biggest plant in the country devoted exclusively to making Hay Presses. The Wolverine has made an enviable reputation—and it is maintaining that reputation and increasing its facilities every year to take care of the growing demand.

A smooth, even, heavy bale comes from the Wolverine Hay Press. It is a fact that dealers will often pay more for hay put up in nice bales. It eats hay as fast as it can be handled by four men in a mow. It can be depended upon to work every hour in the day without a repair man constantly "tinkering" around. It is built for hard, long service.

Wolverine Hay Press

WOLVERINE CONSTRUCTION DEFIES DESTRUCTION

The Wolverine is built both with steel and wood frames, four different sizes, all with double gears, with various equipments to suit the requirements of purchasers. It isn't the cheapest Hay Press made, if first cost is considered, but it is the cheapest baler in the long run because there is an absence of repair bills.



Write FOR THE "Wolverine Book"

Every farmer will find many interesting and instructive things in the "Wolverine Book." A postal will bring this book to you. It's worth asking for.

CONTENTS THIS WEEK

THE LOQUAT OR JAPAN PLUM, Cover.
SUGAR BEET GROWERS GATHER AT INSTITUTE, 731.
CITRUS AND TROPICAL FRUITS.—Sour Stock; Magnesia-Lime; 732, 733.
DECIDUOUS FRUIT CULTURE.—The California Peach Tree Borer; Nitrogen Gathering Bacteria; 734, 735.
LIVESTOCK AND DAIRY.—The Milk Inspectors; Cow Testing Association; Dairying Score Card; Animal Happiness on the Farm; 736, 737.
SMALL FRUITS AND VEGETABLES.—Strawberries Out of Season; Cloth Shade for Lettuce; Sweets in Merced County; 738.
GENERAL AGRICULTURE.—Saccharine Tabooed; Sugar Consumption; City and County Law; Borax in the United States; The Labor Question; Why We Advocate Beets; 739, 746.
EDITORIAL.—The Guernsey Cattle Interest; Thinning Fruit; Another Pest; Some of California's Products; Shamel's Work; Bean Day; 740.
AGRICULTURAL NEWS NOTES OF THE PACIFIC COAST.—Northern, Central, Southern, The Coast; 741.
PROFIT IN THE POULTRY YARD.—Importance of Water; Rheumatism in Poultry; 742.
VETERINARY.—Sick Pigs; Stiff Knee; Abscess and Fistula; Abnormal Milk; 744.
LEGAL.—Acquiring Road Right; Cousins Marrying; Section Lines; 744.
QUESTIONS AND ANSWERS.—Watering Peaches; Rhode Island Reds; Picking of Ducks; Rye; Bee Paralysis; Scions on Olives Starting; Green Cabbage Worms; 745.
HOUSEHOLD DEPARTMENT.—The Three Fishers; The Cat That Killed Care; Mexican Frijole Soup; 748, 749.
PRODUCE MARKET.—Los Angeles Market; San Francisco Market; Deciduous Market; Citrus Market; 750, 751.

The sugar beet acreage the state over is reported much greater this year than ever before. One or two sections show a slight shrinkage, but on the whole there will be a large increase of output.

GUERNSEY CATTLE INTEREST.

The largest attended meeting of the American Guernsey Cattle Club was recently held in New York City, and showed great progress for the breed. The report of the secretary showed that there are now in the Herd Register 19,010 bulls and 35,277 cows, the number having nearly doubled during the last five years. An interesting census was given showing that there were 17,846 Guernseys distributed among 1293 breeders. The state of Wisconsin had 2991, New York 2308, and Pennsylvania 2006. During the last year 818 Guernseys have been imported to this country. Thirty-five persons have joined the club last year.

During the five years the Advanced Register has been established 107 bulls and 1270 cows have been admitted. The club is now following the records of 554 animals in their year's work.

The great feature of the year in the annals of the Guernsey has been the winning of the great Iowa State Dairy Cow Contest by Mr. W. W. Marsh's three cows. In this not only did the Guernseys have the leading cow in Dairymaid of Pinehurst 24,656, Adv. R. 843, Year's Record: 14,562.4 lbs. milk, 860.26 lbs. butter fat.

Officers chosen were: Pres. J. M. Codman, Brookline, Mass.; vice president, Ex-Gov. W. D. Hoard of Fort Atkinson, Wis.; Ezra Michener, Michener, Pa.; secretary and treasurer, Wm. H. Caldwell, Peterboro, N. H.; members of executive for four years: Chas. L. Hill, Rosendale, Wis.; W. W. Marsh, Waterloo, Ia.; member of executive committee for three years to fill unexpired term: E. T. Gill, Haddonfield, N. J.

THINNING FRUIT.

It is already late to discuss the thinning of fruit, but if there is one orchardist who has overloaded trees and has not attended to it, let him get busy. We note the headlines of a farm paper of the Northwest which says: "You can afford to be reckless when it comes to thinning fruit." This reminds us of a remark at a fruit growers convention some years ago. The matter of thinning peaches was under discussion. One good peach grower gave his experience as nearly as we can remember as follows: "I first took off twice as much fruit as should have been taken off, then waited a couple of weeks, taking twice as much as I should have taken off. I waited another two weeks and when I saw the weight of fruit left on the trees I knocked them all off, and still there were too many left."

ANOTHER PEST.

Horticultural Commissioner Beers of Santa Barbara County has reports from some sections of his district that much damage was done this season to lima beans and other seed crops because of ravages of a very small centipede, Scolopendrella californica. Upon investigation Mr. Beers has found that the asparagus fields on Bouldin Island near Sacramento, were the scene of its first appearance, or at least the first report of its appearance in the state. Regarding this pest, it is said that it belongs to "an ancestral group and represents the parent of both centipedes and insects."

Dr. Chittenden, of Washington, D. C., Department of Agriculture, says: "These creatures will bear close watching. I have always been of the opinion that they are absolutely harmless."

Mr. Beers adds, "He seems to regard them as purely scavengers, but without doubt they are fond of vegetable growth, as they destroy lima beans, garden beans, asparagus, sprouting corn and melon seeds in the stage of bursting forth from the covering."

Professor Woodworth says: "Heretofore the food of the Scolopendrella has been supposed to be minute insects but there can be no doubt about its vegetable feeding habits."

SOME OF CALIFORNIA'S PRODUCTS.

California produces of barley $23,874,000; of wheat $16,074,000; of oats it produces much less, coming down to $4,162,000, and the great staple of the middle west, corn, is still left on the down side of the ledger with only $1,470,000. The production of beet sugar is the great factor in the state's productive industry that now passes the twelve million dollar mark. The production of lima beans is no inconsiderable factor in our welfare, for that homely product brings in ten millions of dollars yearly. Potatoes make a good showing with nearly seven million to their credit. Onions are not so strong, for they barely exceed one million dollars. Dairy products approach thirty million dollars, while fish and game, often considered of little commercial value, show a credit of five million dollars. In fruits, the citrus is a long leader. It now brings to the state in excess of $30,000,000 annually. Fresh deciduous of all kinds bring nearly fifteen millions of dollars. Dried fruits, including prunes but not including raisins, nearly $18,000,000. Canned fruits loom up well with a credit of $10,000,000. Olives and olive oil are not so extensive as they will be some day, but they already have a credit of nearly two million dollars. Wine and brandy have a credit of $21,300,000. Table grapes look good with a return of nearly $5,000,000.

SHAMEL'S WORK.

The first authorized statement of the Bureau of Plant Industry on the work of Mr. A. D. Shamel, in the orange groves of California, is just out in the form of circular No. 77. It gives a statement as to the beginnings of this work, the objects of the investigations, with list of varieties selected for performance records, and location of the various plats. The numbers of the different records are referred to and illustrated with good photographs. Methods of picking, grading, sizing, together with counting and weighing and facsimile of blanks used are given. Suggestion is made for the formation of citrus improvement clubs, together with individual work by orchardists. The importance of uniformly productive trees is given particular attention. Any citrus grower interested may secure the circular by writing the department.

BEAN DAY.

Lima bean growers of Southern California are all invited to celebrate Lima Bean Day in Ventura, Saturday, July 1st. It is anticipated that this will bring the biggest gathering of lima bean growers ever brought together at one time. Information is to be gathered as to the present crop and as to best methods of disposing of it. The lima bean growers have shown an example of successful co-operation in the marketing of last year's crop. We doubt not this meeting will still further perfect last year's system.

The Maine Agricultural Experiment Station has given more attention to poultry questions than any other station in the country. It has issued a number of good reports, and now comes another circular, No. 398, a book of over 200 pages, dealing with poultry diseases and their treatment. Residents of Maine receive the book free of cost, but those outside the state are asked to remit 25 cents in coin.

The work is extensive in its scope and detailed in its treatment. Practically all of the known diseases of poultry are treated at greater or less length. Furthermore, chapters are added on such subjects as general poultry hygiene, including poultry house hygiene and sanitation and hygienic feeding; the diagnosis of the diseases of poultry; medicines likely to be found useful by the poultry doctor; and poultry surgery. Special attention is given the common diseases of chickens.

Regarding the short editorial note in last week's Cultivator stating that charges had been filed by Mr. James Berry against the Chief of the Weather Bureau, we are informed that the committee in Congress having to do with the expenditures of the Department of Agriculture, took up these charges and not considering them worthy of following farther, has dropped the entire matter. This information was given to us in a letter received from Washington. The Weather Bureau has been of inestimable service to many interests of this country, and it would be unfortunate if its efficiency were lowered by any scandal.

In an extended review of the most excellent book of fiction, "The Story of the Soil," which appeared in a recent Cultivator, we neglected to state that the book was published by Richard G. Badger of the Gorham Press, 194 Boylston St., Boston. The Cultivator will soon be in shape to supply this book to its subscribers. We spoke of its being fiction, which it is, but it is so full of interesting facts regarding the soil, physical and chemical, that it is a wonderfully instructive book.

Patterning after the Australian egg-laying contests, the Philadelphia North American will organize a contest to take place in the near future. This will be the first of its kind attempted in America. Some of the best poultry people in the country have been engaged to act as advisors and overseers of the contest. It is claimed that the United States produces about thirty billions of eggs annually, or nearly 300 eggs for each man, woman and child in the country. Averaging the production of the hen at 80 eggs per year, it requires 370,000,000 hens to furnish this number of eggs. The idea is to encourage the hens to greater production and the farmer to more discriminating selection of hens which will accomplish results.

The University Farm School at Davis is sending out its announcement for 1911 and '12. We note the first term begins on September 11th. The University Farm School opened for instruction in January, 1909. Its purpose is to furnish technical training in agriculture to those who do not wish, or do not feel able, to pursue a college course. The regular course of study is for three years, and does not fulfill the requirements for entrance to college. Special students of sufficient maturity and earnestness may be permitted to take such subjects as suit their needs.

Agricultural News Notes of the Pacific Coast

Northern California

In spite of late frosts Red Bluff, Tehama County, reports a big apple crop.

Fairoaks, Sacramento County, reports the finest setting of oranges ever in that section.

The Butte County Farmers Mutual Insurance Company has filed articles of incorporation.

Cattle growers of eastern Butte County are perplexed at the continued stealing of cattle.

Fifty growers of Ukiah, Mendocino County, have united and will establish a co-operative winery.

The Ukiah Poultry Association has united its forces with those of the Farmers Club of that city.

A Sacramento County dairyman has closed a deal to supply 300 gallons of milk daily to San Francisco.

Vina, Tehama County, will have a bumper crop of wine grapes and a fair crop of practically all other fruit.

Chico, Butte County, reports snow three feet deep in the higher portions of the mountains to the east of that city.

Sacramento Valley is discussing the advisability of one large exhibit building for the entire northern end of the state.

Sutter County farmers are planting beans on some of the overflowed lands. A very large acreage will be put in.

The government fish hatchery at Hornbrook, Siskiyou County, hatched over 2,500,000 rainbow trout during the last year.

Beet planters near Davis, Yolo County, are pleased with the outlook for the coming crop; the cool weather has been very beneficial.

The effort of the government to secure control of the Calaveras Big Tree Grove has brought out a valuation of $1,000,000 by the present owners.

The complete record of the rainfall of Ukiah for the season shows it to be 32.80 inches. The average for the past 34 years has been 37.16 inches.

The state highway act known as the Chandler bill became effective last week, and now it is possible to proceed with the $18,000,000 highway construction.

It is proposed by the superintendent of grounds of the capitol at Sacramento to convert about three acres into a garden in which native plants only shall be admitted.

The canning season for fruits and vegetables in the Sacramento Valley will be from one to three weeks later this year than last. The local canneries are now working on asparagus and in a small way on cherries.

From over 200 varieties of rice grown in an experimental way at Biggs, Butte County, some three varieties have been demonstrated best adapted to the local conditions, and 00 acres are in rice fields this year.

San Francisco capitalists will finance a proposition looking towards the irrigation of large tracts of land north and east of Sacramento. The water will be brought from Amador county. A part of the scheme contemplates a 150,000,000,000 gallon reservoir.

Central California

A meeting is to be held today at Porterville to discuss the fertilization of citrus groves.

The Sempervirens Club of California held an annual banquet at San Jose last Saturday.

Twenty-five carloads of fine beef cattle were shipped out of Porterville last week. Stock was valued at $30,000.

Terra Bella, Tulare County, has just finished its deepest well, being 450 feet. It shows a column of water 400 feet deep.

The Fresno County Fair Association directors are planning extensive improvements on the county fair grounds.

Apple growers of the Pajaro Valley do not like the Heyburn cold storage bill and scores of letters are going to California senators.

The friends of the Big Basin or Sempervirens Park in Santa Cruz and Santa Clara Counties, are working to secure a better highway entrance to the park.

The management of the Apple Annual of Watsonville is looking about for competent judges to place the awards on exhibits to be made at the second annual.

The Fresno County board of supervisors is being urged to make a full levy of 6 cents per $100 on all taxable property in aid of Fresno County participation in the 1915 Exposition.

The prune growers of Santa Clara are endeavoring to solve the white labor problem and it has been suggested that a free employment agency be established in San Jose to supply the desired white help.

An enthusiastic plant breeder at Porterville maintains that he has produced a seedless tomato. We presume that the tomato will have to be grafted on a live oak tree in order to perpetuate its species.

Secretary Miot of the Tulare County Board of Trade suggests a meeting of promotion organizations of San Joaquin Valley to discuss the matter of uniting to display the products of the Valley at the San Francisco Exposition.

The state horticultural commissioner has issued a quarantine order against receipt of alfalfa from the state of Utah because of the alfalfa leaf weevil; also against Colorado and Texas potatoes infested with the potato beetle.

Lovers of birds are urging squirrel poisoners to use poisoned barley instead of poisoned wheat in the work of destruction. It has been stated that the dove and quail will not eat the barley while they will invariably clean up any scattered wheat and besides the poisoned barley has been found to work even better with the squirrels.

The Visalia Grange is out with a formal resolution urging the adoption of a 90-pound grain sack in place of the present large one holding about 125 to 140 pounds. The principal reason given is that the large grain sack is too heavy for easy handling by "the large number of women poultry keepers which is continually increasing." Another reason given is that the larger size is more likely to burst and cause loss of grain.

Southern California

Escondido will begin shipping of apricots about June 23.

Escondido apricot growers hope for a 14 or 15 cent price on dried cots.

Hopper catchers are proving effective in the vineyards of Imperial Valley.

Calexico is already shipping sugar beets to the factory at Glendale, Arizona.

Ventura County bean growers have lost much from the ravages of cutworms.

The cotton gin at Imperial which was burned some months ago is to be rebuilt.

The scarcity of Japanese labor is causing some to turn to the Hindus for help in emergencies.

The latest ambition of Calexico, Imperial County, is the establishing of a sugar beet factory, which it is claimed it will secure within two years.

Lemon growers are pleased at the prices being received; some exceptionally fine fruit has struck hot weather to the tune of $7 per box.

Ventura County is planning for a celebration of Lima Bean Day on July 1. A special invitation is extended to every Lima bean grower in California.

The California Fruit Growers Exchange has recently purchased large timber tracts which will supply material for orange boxes for several years.

Anaheim, Orange County, beet fields have been held back by the cold weather so that it will be the middle or last of July before harvesting can begin.

The first good healthy Russian thistle found in Imperial Valley has started a commotion which will probably result in a still hunt for any others of this pest.

The Gregory Fruit Company at Colton is making extensive changes and improvements in the cannery, and will soon be ready for opening on the summer pack.

Potato growers of several sections in the San Gabriel Valley have formed the San Gabriel Valley Growers Potato Association, hoping to secure better returns on the market.

Bee inspectors of several southern counties have been busy attempting to run down a car of bees from San Joaquin Valley which it was stated was infested with foul brood.

An agronomist in charge of grain and sorghum investigations and representing the Bureau of Plant Industry of Washington is investigating Dwarf Milo Maize, for which seed has been distributed from the department.

Horticultural Commissioner Essig of Ventura County has called a meeting of farmers and fruit growers to be held at the city hall, Santa Paula, next Thursday, June 29. Methods of fumigation, spraying and quarantine will be discussed.

With 750 cars of cantaloupes in transit and 140 cars a day being added to the quantity, the melon growers of Imperial Valley called a special meeting and decided that, notwithstanding the rapidity of ripening, shipments should be arbitrarily reduced to seventy cars at least.

The Coast

Alfalfa growers at Gifford, Washington, are making a first cut.

Cantaloupes and alfalfa at Yuma, Arizona, are revelling in a 110 degree temperature.

Oregon's winter wheat condition is reported as 95 per cent as against 92 per cent for the ten-year average.

A sheep grower at Pullman, Washington, has lost a number of valuable Shropshires because of bloating on alfalfa.

Well wishers of the advancement of Northern Washington, are urging more serious consideration of irrigation methods.

Farmers near Wilcox, Arizona, anticipate a greatly enlarged market from the development of mines in that section.

Potato growers at Grangeville, Idaho, have a contract for the furnishing of all potatoes to the Northern Pacific dining service.

The secretary of the interior has sent an agent to investigate the delay in the completion of the Milk River reclamation project in Montana.

A dairyman at Bozeman, Montana, has a Jersey which produced for him within seven days 450.2 pounds of milk and 21.24 pounds of butterfat.

A dry farming expert near Wilcox, Cochise County, Arizona, is exhibiting a bunch of wheat grown from one kernel, on which is 239 heads of wheat.

Kititas County, Washington, contemplates reclamation through irrigation of 90,000 acres of land. It is estimated that the cost will be $70 per acre.

One of the greatest irrigation efforts undertaken in this country is in contemplation on the Medina River near San Antonio, Texas. It will cost $6,000,000.

The controversy over the establishment of the San Carlos dam site near Tucson, Arizona, has resulted in a request to the secretary of the interior to make a visit to the San Carlos Reservation.

The Washington County, Oregon, Cow-testing Association is doing good work in showing the dairymen the production of each of their cows. The "star-boarders" will be eliminated from the herds.

A farmer at Pampa, Washington, is enthusiastic over the discovery of an enemy of the dreaded "Jim Hill" mustard, in a wire worm that leaves wheat untouched, preferring the weed as an article of diet.

A new agricultural school has just been established at Lais, Mindanao, P. I. It is hoped to make this school a sort of agricultural station for the introduction and trying out of trees and plants adapted to this region.

A financial corporation has been organized in Portland, Oregon, to make loans on stock fed for the Portland market. Nearly all the banks in Oregon, Idaho and Southwestern Washington have promised to co-operate.

The holdover hay is so scarce at Toppenish, Washington, that California hay is being shipped in and the local growers are contemplating baling their hay without the usual sweat in the stack so as to meet the demand.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will convey a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

THE IMPORTANCE OF WATER.

By Mrs. A. Basley.

A brood of Indian Runner ducks have sore eyes, showing a milky looking foam, the disease seems to be going through the entire flock. The only trouble is that the ducks have not a deep enough water vessel. Ducks require to rinse their nostrils frequently during the day. The drinking vessel should be deep enough for them to immerse their whole heads or at any rate as far as the eyes. Otherwise they cannot clean out the nostrils, the mucus hardens and frequently an abscess will form and the eyes become affected. It possibly may be necessary to inject a little oil, (castor oil) in the nostril that is stopped up, to soften the mucus, but usually a good supply of clean water is all that is necessary.

Where poultry is kept in confinement there is perhaps nothing so important in the feed as the water supply. Water is the cheapest part of the food and yet how careless many are in supplying it and in keeping the vessels sweet and clean! Water is the great carrier which alone can convey anything into the animal system, and without it all food would be useless. This is especially the case with fowls and notably our domestic hen. The body of the hen is more than half water, while over three-fourths of the contents of the egg is water. How more than necessary it is to give the hens clean water. A friend of mine says when she cleans out the water vessels, "I have to drink or rather eat this water myself in the hen's egg and I don't like dirty water." Sometimes water has been left to warm in the sun. Warm water if clean will not hurt a chick or a fowl any more than it will human beings. It is not as palatable, it is true, but nevertheless, it is harmless if it is clean. When, however, chicks are allowed to run on ground of their own droppings and then in their water dishes the water thus polluted, especially if warm, will develop poison, for nothing is more poisonous to all animals than emanations of their own excrement. Many a lot of promising chicks has died off one after another till the whole flock was depleted and all sorts of remedies given to stop the fatality, while the owner laid it to his own bad luck or anything under the sun except the true cause, drinking polluted water.

I have used all kinds of water and found it equally good as long as it was kept free from poisonous droppings brought into the water on the feet of the little chicks. River water, well water, spring water, warm water, the ditch water or canal water, it is all good so long as it is kept free from animal or fowl pollutions, which contain the deadly poison that yearly kills off thousands of little chickens, and particularly brooder chicks, where water is often suplied in such a way that little chicks can get into it.

The only proper way to give water in a brooder is to use a fountain. They cannot get into that, and one good drinking fountain is an effectual protector against this deadly menace of filthy water, and never let the fountain go empty. You cannot grow chickens successfully without as good a supply of water as of food, for without the water the food will not be properly assimilated.

As to the laying hen, clean and wholesome water must be given to her if she is to do her best in providing the eggs from which the chickens are to be hatched. A hen may be able to live on the water contained in the green feed supplied to her, but she will not be productive of eggs; if the water supply suddenly stops, the egg output will stop also. A laying hen is much like a milking cow, both require a great deal more water than if free from the drain on their natural powers, and nothing will more certainly arrest the milk giving of the cow or the laying of the hen than an insufficient supply of water. In warm weather a hen which is laying and fed on grain will drink or waste in the awkward way she lifts it, three-quarters of a pint a day. If you watch your hens carefully you will see that they will take a good drink before going to roost and another the first thing in the morning and either just before or just after laying.

Keep all dishes and fountains scrupulously clean; at least once or twice a week scald them with boiling water in which washing soda has been put. Neglect anything rather than the water supply, for success cannot be attained without this important factor in chicken culture. But where chickens are raised for profit as well as for pleasure, nothing should be neglected, but every little detail carefully attended to.

Ducks require even more water than chickens; they like to take a mouthful of water at each bite of food, and if they cannot get their nostrils well under the water they are sure to suffer from getting their heads stopped up and from indigestion.

I found that the best way of keeping plenty of water and clean water for ducks was to get a barrel and saw it in two one-third of the way from the end with the bunghole in it. Dig a hole deep enough to bury the large part of the barrel, knock the bottom out of it, and put the one-third on to that. Fit a broom handle into the bunghole, and keep this top part of the barrel, which should be level with the ground, full of water. Every day let the dirty water run out and leak away through the bottom of the barrel, and fill up with fresh. Of course you could use a box or anything that would hold the third of the barrel steady and yet allow the water to run away. This was the most satisfactory arrangement that I could make for my Indian Runner ducks. I had tried a cement basin and various other forms of drinking vessels, but this was more easily handled, cheaper, and suited me better than any other plan.

RHEUMATISM IN POULTRY.

Damp floors and walls bring on rheumatism. Throw open the chicken house on fine days and let the blessed sunshine in. Pure, dry, air is much healthier than warm air highly charged with moisture. Rheumatism is almost never seen in flocks where the quarters are dry. A little common baking soda put in the water where the hens drink will help to prevent a leg weakness. Water fowls —geese and ducks — cannot stand dampness in their quarters any better than chickens. A great many people ignore this fact. They imagine because ducks and geese like water they do not need dry sleeping quarters. They do not roost high up as do chickens, but prefer dry clean straw to squat on at night. Where boards are used as a floor, there is apt to be more or less drafts from cracks unless a quantity of dry dirt or sand is kept on the floors. A scratching shed should always have a floor of earth. Such a floor is absolutely free from drafts. Cover it well with litter and you will then have no rheumatism among your fowls.

The road to prosperity is chuck full uv autermobiles.

Sick Pigs.

Pigs four to six weeks old lose their appetite; the eyelids are swollen and sore; they stagger around, apparently unable to see; dwindle for about eight or ten days; and die. The pigs are run on alfalfa and receive daily a small feed of milo maize, and are fat when taken sick. The pigs die, but the old hogs are not affected. Last fall I had fine success with pigs under similar conditions and handled just the same.—Subscriber, Brawley.

This is a contagious disease of a febrile character. The sows may have passed through the disease and are for that reason immune. Hold a post mortem examination on one of the pigs which die of the disease and examine the lungs, kidneys, liver and other organs. Rip the large gut open and wash its lining and look for ulcers. Then write this department, giving a full description of your findings.—F. G. M.

Stiff Knee.

My mare one year ago had two little bunches appear on the knee joint. These were soft at first, but became larger and bony later, and other lumps are now coming out around the joint, which is beginning to show stiffness.—Subscriber, Lodi.

Bony growths in the knee joint when of long standing cannot be removed. However, a liniment made by mixing the following ingredients may be used to check the progress of the disease and relieve the pain: Oil of cedar, half ounce; chloroform, one ounce; tincture of capsicum, two ounces; spirits of camphor, two ounces; tincture of iodine, half ounce, and alcohol, two ounces. Shake before using and apply with friction once daily.—F. G. M.

Abscess and Fistula.

My mare began to lose flesh about two months ago. The veterinarian attendant opened an abscess on her breast, and this was washed out with antiseptics twice daily. Now there is a lump about the size of a turkey egg, and this is quite hard, with some fever, but very little discharge. Another veterinarian pronounced this a fistula, but treatment has not improved the animal. When driven faster than a walk she will cough and breathe with difficulty.—Subscriber, Riverside.

An abscess is a collection of matter (pus), and after an abscess is opened if matter continues to flow from the opening for a long time the condition is then termed a fistula, therefore both veterinarians were correct. If the cough and difficult breathing is due to this locally diseased condition, the windpipe or some large blood vessel, or both, must be involved, hence it would be advisable to have a qualified veterinarian probe the fistulous tract with the object of determining its depth and direction and the vital organ approached. It would be far better to trust the treatment to a veterinarian, as an operation may be required.—F. G. W.

Abnormal Milk.

A Jersey cow which seems to be in perfect health, yields milk which at times is not right, becoming thick while still sweet, and apparently containing an excess of water, and a very thin film of cream comes over it. Ordinarily her cream is abundant.—Subscriber, Folsom.

The milk of some cows is affected at the periods of heat. But if the change in the milk does not occur near her periods the subscriber is advised to draw the milk from each teat into separate vessels and observe if the change in the milk applies to all four quarters or only one or two. If the latter, the disease is localized in the udder, but if all samples are affected alike the trouble is systemic. In case it proves to be a systemic trouble, give the cow one pound of epsom salts in water as a drench, and follow with hyposulphite of soda, one tablespoonful in the feed twice daily. If localized in the udder, supplement the treatment by rubbing into the affected quarter or quarters an ointment containing five per cent of oliate of mercury.—F. G. W.

Legal

Edw. L. Payne, attorney, 301-304 Douglas Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Payne is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Acquiring Road Right.

A owns 60 acres and B and C owning other lands have to go through A's place to get to the county road. There are two separate roads through the place. Part of the year they go on one and the remainder of the year the other. To get out to the public highway they open two gates. Have they established a road? A has owned the land for four years and both B and C traveled it several years before A bought his place.—F. P., Visalia.

The first part of the question is worded so that it appears that B and C have no other means of access to their property except through A's land; if so, B and C have a right of way by necessity; assuming, however, that they have other means of ingress and egress, the maintaining of gates by A might be considered as evidence that A retained control of the roadway, and has merely given B and C a license which might be revoked.—E. L. P.

Cousins Marrying.

May cousins marry in California?—Subscriber.

There is no law prohibiting the intermarriage of cousins in California.—E. L. P.

Section Lines.

A section is square with the world on three sides, but on the fourth the line starts from the southwest corner and runs 7 degrees west of north. This takes in some 6 or 7 extra acres. West line is, however, along the steep wall of the canyon where the land is inaccessible and worthless. Does the law require that in dividing north and south lines shall run at varying angles,

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Watering Peaches.

How frequently should bearing peach trees be irrigated and is there danger of watering too near to picking time, thus making the fruit watery?—Subscriber, Glenn.

One good watering shortly before ripening will not have any deleterious effect on peaches. I have practiced it for years and have only found good results. It is the continuous watering, as when small fruits are planted between the trees and watered every couple of weeks or even oftener throughout the season, that works injury to the peaches.—Q. A. L.

Number of times or particular time of watering any orchard tree must depend more upon its condition than upon any rule. So long as the tree is growing well and in good condition it needs no water, but it is necessary to keep careful watch so as to anticipate its needs. There should be sufficient moisture in the ground during the growing season to keep the young growth from withering.

Rhode Island Reds.

Kindly give me through your question column information as to the origin of the Rhode Island Reds.—F. S.

The Rhode Island Reds come from the little state from which they take their name, and they may be said to be the oldest, newest breed in the United States. Their origin is somewhat undecided. They were popular fifty years ago, and were then said to be raised from the Red Cochin China cocks brought to Little Compton, R. I., by sea captains and crossed with the common fowls there. A little later came the great Malay fowls from the peninsula of that name. Their color was dark red or brown, streaked with yellow, some varieties more red than others. The Red Cochin and the Red Malay cocks were crossed with the flocks of fowls at Little Compton forty or fifty years ago. There was also a red variety of Chittagonga at that time in that neighborhood.

They are excellent utility fowls. The dressed poultry is nearly all uniformly yellow skinned, yellow legged, plump and meaty. The eggs are brown, uniformly good sized. We do not consider an egg up to standard unless it weighs over two ounces. Very few of our eggs except those laid by young pullets fall under this weight.

The standard weights are: Cock, 8½ pounds; hen, 6½ pounds; cockerel, 7½, and pullet, 5 pounds. The general surface of the plumage is a rich brilliant red, except where black is desired. Depth of color (red) is slightly accentuated on wing bows and back, terminating in a tail of glossy bottle green black.—A. B.

Picking a Duck.

Will some reader of the Cultivator give me the best method of cleaning a duck. I find the down is very hard to get off.—Subscriber, Orosi.

Probably the easiest way is to remove the feathers dry while the natural heat of the body is yet in the bird. Some prefer to select a heavy board wider and longer than the bird and drive two nails firmly at the top, and to these tie the duck securely as soon as slaughtered. Set boards slanting on the table and scald wings and tail for easier removal of the large feathers. Pick breast and back first, working rapidly with both hands. When the larger feathers are off the down remains. Hold the bird first by the wings, then by the feet over a quick blaze. (This does not make the finest looking carcass.) Use knife blade to remove pin feathers. Some prefer to scald, then wrap in hot towel for a few moments when the down is more readily removed. However, as the subscriber asks other readers to send in suggestions, we will ask for better methods.

Rye.

What is the feeding value of rye hay compared with other grain hay, and also is the grain good for poultry feed?—Subscriber, San Jacinto.

We are unable to give the analysis of rye hay, but do not think it would be equal to either good barley, oat or wheat hay. Rye, the grain, ground to a meal, is practically the equivalent of corn-meal. We do not think it would be a desirable complete food, but would be excellent in forming a balanced ration.

Bee Paralysis.

I have used sprinkling of salt water (not too strong), and powdered sulphur. Take small can, perforate cover, using same as shaker, shake sulphur on top of combs, also bottom board, below combs. The bees will work and take out the sulphur at once. The disease disappeared from my hives although I could not say if the above is a sure cure. Another way is to replace the queen. I had one colony that had the disease, but after the weather turned warmer they got over it without treatment. I marked hive and found the same colony had disease this spring, and I will replace queen this year.—Hy. Bauer, Fillmore.

Scions on Olives Starting.

How long after olives are grafted should the scions start? When should the twine be cut?—Subscriber, Hemet.

Length of time before new growth will start depends upon the condition of the tree and upon the weather. The cutting of the twine is also best determined by watching the condition of the bark; until the growth begins to swell the stock so that the string cuts in there is no harm in leaving the twine on.

Green Cabbage Worms.

When things go wrong we always look to the Cultivator for aid, and so we are calling on you this time to ask the following questions: What will prevent or kill green worms that I find on my cabbage? They hatch from eggs of a white miller or butterfly. We object to using Paris green or other poison on them. What will keep away the worms that are found in sweet corn? Last year had a great deal of trouble with them and would like to know something to prevent them from coming.—J. E., Lincoln.

On such plants it is possibly safer to use white hellebore, formula for which is given in the special spraying issue of the Cultivator for November 3rd as follows: Hellebore one pound, water 50 gallons. Mix the hellebore with a small quantity of water first, then pour into the spraying tank, or if preferred, it may be used dry, mixed with road dust or flour, say one pound of the hellebore to five or even ten of the diluent. This pest is sometimes treated with hot water, poured almost boiling over the cabbage. It may seem that this would destroy the plant, but cabbage will stand very hot water. Hand picking is also an effective method of handling the worm.

WEBER WAGONS

It was in 1845 that the first Weber wagon was built. From that day to this every effort has been made to build them the way the farmer wants them. Think of it—sixty-three years of steady advancement. It is no wonder that they are known as "King of all." Every element of excellence in wagon construction is embodied in the Weber. The best quality of material is used; it is properly constructed, and attractively finished.

Tulare County shipped 2861 cars of oranges this year.

Some use the arsenate sprays and find them satisfactory.

The sweet corn worm is another proposition, and there seems to be no way of reaching it. The only plan followed is to plant a larger quantity of corn than is required. The eggs are laid in such a way that it is impossible to reach them with poisons.

BEET GROWERS INSTITUTE.

(Continued from Page 731.)

a correct version, we quote as follows: He who by agriculture would get rich Must plow, and cultivate,—and sich. Work hard all day, sleep hard all night * * * and not get tight.

Prof. Shaw's talk was along the line of humus, and as we have quoted so fully from him in the past we will not give of his address, but remind those who were present at that time that the Professor omitted to give one of his usual slogans or catch phrases which is "With all your getting, get humus." An explanation from the Professor is due along this line.

Prof. Shaw later made another address on the irrigation of sugar beets, and from this we may quote in another issue of the Cultivator.

Mr. A. Miles spoke upon labor problems affecting the Salinas Valley and the state in general, from which we quote:

THE LABOR QUESTION IN THE BEET FIELD.

By A. Miles.

Years ago we had a competitive system of labor between the Chinese and the Japanese. Finally, the Japanese gained control of the entire business. Just about that time prices began to rise in every direction. To assist the farmer in meeting these increased expenses, as much as to encourage the industry of beet raising, the Spreckels Sugar Company paid more for the beets delivered to it; but the Japanese, being virtually in control of the situation, reached out and grabbed all the benefits which would accrue to the farmer from this source, by demanding more for their labor. Then again the Sugar Company took hold of that side of the question, at an expense to it of many thousands of dollars. It sought and tried out various classes of labor, meeting with reverses and discouragement on all sides. The Hindu was found the most adaptable to this particular kind of work and the company took the initiative in training these men to the work of the beet field. It required some years of indefatigable labor to accomplish results, to say nothing of the expenditure of much money, and patiently bearing the murmurs of discontent heard on all sides; but finally such results were attained that any aprehension any of you may have had—and justly so, I will admit—as to the culture of the sugar beet, may now be entirely and safely swept away. The present season the Hindus have contracted to care for 1200 acres of beets, and for lack of territory, we are refusing offers almost daily. So it will be the next year, and the next, and so on. Under these circumstances the Japanese are content to work for a fair rate of wage, instead of claiming all the traffic would bear, so to speak, and thus making the business prohibitive.

The program was closed by an address by Mr. R. L. Adams, Supt. of the Experiment Station, in which he answered the question, "Why do we advocate beets." In part, Mr. Adams' address follows:

WHY WE ADVOCATE BEETS.

By R. L. Adams.

Only a good farmer can raise the sugar beet. The crop is exacting and to make its fullest development requires special attention from the time the ground is first broken in anticipation of seeding until the crop is finally delivered at the mill. The host of details demand immediate and intelligent action. Failure to comply with the crop's demand will always be shown in a reduced yield or a reduced sugar content. For this reason only good farmers make a success of beets. On the other hand when you see a man making a success of his beet crop you may put it down that this man is a thorough farmer who understands his soil and crop, and gives both the proper handling.

The sugar beet has played an important part in the development of Monterey County. According to figures given out by County Clerk T. P. Joy the value of the crop among all those grown in 1910 was second. Barley alone exceeded the value of the beet crop to the farmers and that by only $50,000, which considering the fact that over 100,000 acres are grown against fifteen thousand acres of beets or less, is not a very great margin. This means that the sugar beet is an important factor in the financial standing of the county, and everything possible should be done to protect and foster the industry. And what applies here applies in some degree to every county where the sugar beet is raised commercially.

To the average farmer the immediate financial returns are what interest him most, especially if he is a tenant farming under only a short lease. He then aims to get all he can out of the land during the time that he is there. This may not sound charitable but it is human nature. Viewed from the standpoint of acreage returns the sugar beet stands first both in profit and in total value when compared with ordinary farm crops. Using County Clerk Joy's figures again the value of the sugar beet is $57.14 per acre, while the next, second crop—beans—has but a $37.20 value. Averages compiled by a former assistant of mine from figures given by actual growers outside the company show the profits for beets to average nearly $40 per acre or an increased profit over grain of $21.15, over beans of $11.65, over potatoes of $13.40 and over peas of $26.15.

Not only is the sugar beet a paying financial crop in itself but its effect on the soil is markedly beneficial. The deep plowing and thorough cultivation necessary to fit the soil for the beet crop, kill weeds, improve soil texture and make a greater depth of soil available for future crops. The beet itself sends penetrating rootlets deep into the ground forcing the soil particles apart. In decaying these roots leave open channels which greatly facilitate the entrance of air and water. In its growth plant foods are taken from deep down in the lower strata of soil, brought up to the leaves, there to be evaporated and stored in the crown of the plant. In topping this crown is left on the land and in future rotting the store of plant food becomes available for other shallower rooting crops.

Just as the sugar beet has played an important part in the past development of the Salinas Valley and the neighboring sections, even so should it prove a valuable ally in the future. As I speak a spirit of change is noticeable over the land. Wheat and flax were profitable once, but the yields grew less and less, finally forcing the farmers into growing barley. And now barley seems to be following the way of wheat and flax. Less crops are being harvested than formerly. This naturally sets a farmer to thinking "what next?" It is not my aim to attempt to outline a remedy for the great grain fields and show how methods must be instituted which will stop this downward trend—methods involving the return of humus to the soil, the selection of better seed, deeper working of the land, and possibly the application of fertilizers. A widespread system of irrigation has been suggested as the ultimate remedy but this in itself will only postpone the evil. It will not do away with it. What I wish to do is to suggest the greater use of the sugar beet on such lands as will grow it profitably. All lands are not adapted to the sugar beet, but lucky is the man who has a kind of soil which will produce them, for their effect, as outlined before, will go far towards correcting evil conditions. More beets can well be considered for this Valley, and in their growing both farmer and soil will benefit.

As to the effect on the soil from continuous cropping. On the company's

WHAT IS YOUR POULTRY WORTH?

It has a value, but that value is determined by and dependent upon health conditions. Best and surest poultry health can be obtained and maintained by using

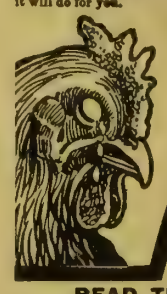
GERMOZONE

A preventive and cure for Roup and Cholera unequaled in efficiency. Germozone is a germicide, a cure and preventive of Cholera and Roup. It is a system builder. It goes to the seat of trouble and usually effects a permanent cure.

Given in the drinking water *twice a week* it cures disease, prevents contagion and keeps the fowls in a healthy, vigorous condition. Prepared either in tablet or liquid form, 50c. We pay postage on tablets.

Germozone is the best health insurance you can have for your poultry. Cost is small and it is sold on *an absolute guarantee.*

Germozone is not an experiment. It has been doing for years for Mr. Lee just what he is telling it will do for you.



LEE'S EGG MAKER

is not a medicine. It is a scientific food product compounded by Mr. Lee, who is a *poultryman* of 25 years' experience. If it were not for the success claimed for it Mr. Lee would never have offered it to the public. That is one broad, sweeping assurance any poultryman has who buys Lee products—they know his own flock has demonstrated their worth to him.

READ THIS GUARANTEE

We guarantee that no matter what you are feeding, and regardless of the number of eggs you are getting at the present time, if Lee's Egg Maker is added to the daily ration—made a portion of it—the increased egg yield resulting therefrom will more than pay the cost of the Egg Maker, cost of labor required, and 100 per cent profit on said labor.

25c, 50c, $2 sizes. The smallest size is large enough to prove you ought to buy more. A larger size would do it quicker—and you would get a little more in proportion to the price.

Write for free copy Lee's "Chicken Talk," written by Geo. H. Lee himself. Also free Mandy Lee Incubator catalog. Yours by first mail.

Correct Grinding

of corn on cob is easily accomplished with the

Fairbanks-Morse Steel Feed Mill

The high price of feed makes it important that you do your feeding on a scientific basis. FAIRBANKS-MORSE FEED MILLS are best on account of their light draft, large capacity, strength and long life. They are designed for slow speed, which reduces friction and wear. A 2 H.-P. Jack-of-all-Trades Engine will run one of these mills, crushing ear corn and grinding it fine in one operation. Shelled corn or other small grains, separate or mixed, can be ground fine in one operation. Made in two sizes: Sacking Elevator can be used with either size. *Moderate price; greatest value ever offered.* Send for Fairbanks-Morse Feed Mill Catalog, No. LD 113 which also shows corn shellers and Fodder cutter.

FARM LANDS FOR SALE.

FOR SALE—
HIGHLY IMPROVED DAIRY and FRUIT RANCH. THE OWNER IS NO FARMER, SO HERE'S YOUR CHANCE IN TULARE COUNTY.
120 acres in alfalfa.
70 acres in bearing fruit.
50 acres in grain.
200 head hogs, select stock.
30 cows, select stock.
15 calves.
7 horses and mules, select stock.
Electric pumping plant and electric power for creamery and feed mill; large house, large barn, all outbuildings, tools, implements; in fact, absolutely everything to run an up-to-date big ranch.
$50,000; only $10,000 down, balance any old time at 6 per cent.
The fruit alone will pay interest and most of the running expenses. You can clear money on this ranch from the very first day, as it will easily carry 120 cows. F7764. JOHN W. THOMSON, 520 S. Main, Los Angeles.

FOR SALE—
LAND BUYERS' CLUB.
RANCHERS' and INVESTORS' ATTENTION
I am forming a club of land buyers to take over 1,000 acres of rich level loam land in Tulare County. This tract has the oldest and best river water right in the county. Every club member will save $50 an acre, and you will admit this after seeing the land. Here's your chance to get 40, 80 or 160 acres at the wholesale price. Remember, this land is in the midst of highly developed and prosperous ranches, yet the club price is very low. Every rancher who joins this club of buyers will save $50 an acre, and every investor that joins will make $50 an acre. F7764, Main 1209. JOHN W. THOMSON, 520 S. Main, Los Angeles.

Twenty Acres, near Dinuba, Tulare County, quarter mile from Southern Pacific, within three miles of three towns; all dry. Accredited high school, telephone, rural delivery. First-class soil, level and under irrigation in best and cheapest irrigation district in this state. Water right with land. Produced 14 tons dried peaches and 11 tons raisins in 1910. Fully equipped for fruit drying with transfer car and steel track throughout. Everything in first-class shape. Price $7,000. For terms address owner, Chas. F. Collins, Dinuba, Cal.

For Sale—San Dimas, Cal. The famous frostless foothill district; located 28 miles east of Los Angeles, on the Santa Fe, Southern Pacific and Pacific Electric Railroads. The home of the largest citrus nurseries and the largest lemon packing house in the world, and one of the largest orange packing houses. The San Dimas district is second to none for the culture of citrus fruits; frostless in winter, cool in summer. For the best buys in citrus property and home in this district, see or write San Dimas Real Estate Co., Inc., San Dimas, Los Angeles Co., Cal.

Money Making Lands in Famous Pajaro Valley—Soils that will grow anything. One 1,000-acre tract suitable for subdivision; fine for fruit and poultry farms. Price $40 an acre. 70-acre eucalyptus proposition, 60 acres in 2 year old trees now 7 to 10 feet high; 10 acres in orchard. Apples worth $1,000. A pick-up at $8,500. For full particulars and list of 50 orchard bargains write to Farm and Forest Realty Co., Watsonville, Cal.

For Sale or Trade—230 acres Oregon land in the famous "Rogue River Valley;" fine fruit land, 40 acres cleared, balance in timber; located ten miles from Central Point. A good two-story farm house, large barn. Fenced with 17-wire "Page Fence." Schoolhouse on corner. Would exchange for Los Angeles country or city property, to value of $8,000 or $10,000. Price $65 per acre. Address J. H. Grace, Central Point, Ore. P. O. Box 203.

For Sale—A 20-acre farm for $20 cash and $20 a month; possession now; $90 to $125 per acre; your crops pay for the land. Rich, level land for alfalfa, oranges, almonds, grapes, cows, chickens; abundance of ditch water, for irrigation, for $1 an acre a year. Where else can you get this? In Oakdale Colony, near good town and railroad station. Climate delightful. T. Wiesendanger, 207 S. Broadway, Los Angeles, Cal.

200 Acres Good Level Land—13 A. orchard; shade trees; 12-room house; 2 barns; windmill and tank house; fruit houses; cream separator; engine; etc. Price $21,000. 12 A. orchard home, good house, 4 rooms and bath, barn, fruit houses, windmill, equipment; complete place. $3600. Yolo & Solano Counties. Wyatt & Wilson, Winters, Cal.

For Sale—20 acres 2½ miles northwest from Garden Grove, Orange Co., Cal. Good house, barn, ½ pumping plant, 90 in. flow of water. 12 acres alfalfa, 5 acres beans, 1 acre out to oranges. First class orange, lemon and alfalfa land. Sandy loam soil. For price and terms write H. H. Reeves, Santa Ana, Cal.

For Sale—Valuable real estate; 80 acres rich black soil, suitable for fruit, grain or alfalfa, one mile from Caldwell Station, near Wheatville. $75 an acre. Good terms, or trade city property. See owner. J. P. Bolton, 1753 K St., Fresno, Cal.

Sub-irrigated Valley Ranches near the sea. Good locations for citrus, walnut and lima beans. Good water. Also citrus land in Reedley, covers best location in the state for lemons and English walnuts. John T. Bramhall, care of Cultivator office.

For Sale—Two small farms, or both as one. Plentiful water supply; good house and barn on one; part in alfalfa; ideal for poultry raising. Address owners for particulars. Leonard Coates Nursery Company, Morganhill, Cal.

For Sale—Near Lancaster, Cal., bargains in improved and unimproved land. Also relinquishments for sale or trade. Some homestead land. A. S. Burnham, Box 451, Lancaster, Cal.

Apple Orchards—Large and small, in the only apple producing section in California. The greatest section west of Missouri River. Write for booklet. Geo. W. Sill & Co., Watsonville, Cal.

POULTRY

The Standard Poultry Yards. Back again with my first love. I have just received from the best White Leghorn breeders in the East 200 selected heavy-weight Knapp and Wyckoff trap nested White Leghorns, not one scoring less than 91 and up to 96 points. I am now prepared to furnish baby chicks and eggs together with my Cook and Kellerstrass White Orpingtons. I feel sure I have the best on the Coast. C. A. Loud, Prop., 3944 Cleveland Ave., San Diego, Cal

Having Purchased the stock and business of the Standard Poultry Yards, we are prepared to furnish on short notice either the Cook or Kellerstrass Crystal White Orpington Eggs for hatching from the finest birds in the land. Give us a call and be convinced. Prices furnished on application. Standard Poultry Yards, E. C. Worden and Son, props., 4004 University Blvd., San Diego, Cal.

All We Know is Rhode Island Red Chickens. But we know them so well that our baby chix, $15 a 100, are the best on earth. There! Pure blood, good strains, well mated by expert breeders. I. X. L. Poultry Yards, 587 Mission St., Santa Cruz, Cal.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

The Goodacre Strains—Just the time to get our Quality Reds, our special offer on eggs from choice matings of $3.00 per 15 or $5.00 per 30 is hard to equal; our commercial day-old chicks we now offer in 100 lots at $12.00; our Reds have been constant winners the past three years in our Coast shows. We can sell you choice eggs, Buff Orpingtons, Anconas and White Runner Ducks. Write us today. Goodacre Bros., Compton, Cal.

BONNELL'S S. C. BLACK MINORCAS WIN EVERY TIME.
At Los Angeles Show, 1911, every first premium and two silver cups; two specials for best male and female. Eggs at half price, $2.50 per setting. C. C. Bonnell, 2919 Brighton Ave., Los Angeles, Cal.

Baby Chicks from my pure-bred stock S. C. White Leghorns, carefully selected for laying and standard qualities. $9.00 per 100, $85.00 per 1000. Eggs for hatching $5.00 per 100. Correspondence solicited. J. R. Heinrich Poultry Yards, Arroyo Grande, Cal.

R. I. Reds—Much time may be saved in producing heavy layers by buying eggs from a breeder who has established a record by specializing in heavy laying stock. Eggs, hundred $5.00, finely pointed; 15, $3.00. "The Luedkes," Anaheim, Route 1.

Rose Comb R. I. Reds—Eggs one-half price balance of season. A few breeders for sale. Young stock later. Mating list on request. W. H. Pickering, 984 E. 55th St., Los Angeles, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. Allaway & Layton Co., 607 E. Third St., Los Angeles, Cal.

White Leghorns—Buff Orpingtons. Bred for beauty and great egg production. Grand lot of both old and young stock for sale. Prices reasonable. Write your wants. Model Poultry Farm, Box H, Irvington, Cal.

For Sale — Beautiful thoroughbred White Leghorn pullets, will lay in August. $7 per dozen. Also extra nice cockerels, no relation, $3 each. Address Mrs. C. L. O., R. R. 9, Box 77, Fresno, Cal.

Blue Andalusians—Beautiful and odd. Not too late to hatch if you have green feed. Eggs $2 per 14, $8 per 120. Two trios at $5 each. Have bred them 11 years. L. A. Wilson, Winters, Cal.

Rhode Island Reds—Eggs for hatching from high grade stock. Also some very choice cockerels, cheap considering quality. Write for prices. Frank Greenleaf, Greenleaf St., Santa Ana, Cal.

Orland Hatchery—White Leghorn chix, $8.50 per 100. $80.00 per 1,000. Brown Leghorn chix, $8.50 per 100. P. L. Simpson, Orland, Cal.

Hicks Jubilee Hatchery, now booking orders. Write us your wants. We use eggs from first-class stock only. Try us. W. J. Hicks, Petaluma, Cal.

White Orpington and White Wyandotte eggs for hatching. Send for list of winnings. Arthur W. Huskins, 713 Waterloo St., Los Angeles, Cal.

Barred Plymouth Rocks—The kind that "Win and Lay." Eggs and stock for sale. C. H. Vodden, Los Gatos, Cal.

Rose Comb Black Minorcas, nine years line bred. Stock and eggs in season. Eleanore Minorca Farm, R. D. 1, Los Angeles, Cal.

TURKEYS.

White Holland Turkey Eggs. I have purchased Mr. Putnam's White Holland first prize hen, whose normal weight is 28 lbs. Her eggs 75c each. All other Holland eggs 35c. Mrs. Hocking, Guasti, San Bernardino Co., Cal.

THE THREE FISHERS.

Three fishers went sailing out into the west,
Out into the west as the sun went down;
Each thought on the woman who loved him the best,
And the children stood watching them out of the town;
For men must work, and women must weep,
And there's little to earn and many to keep,
Though the harbor bar be moaning.

Three wives sat up in the lighthouse tower,
And they trimmed the lamps as the sun went down;
They looked at the squall, and they looked at the shower,
And the night-rach came rolling up ragged and brown.
But men must work, and women must weep,
Though the storms be sudden, and waters deep,
And the harbor bar be moaning.

Three corpses lay out on the shining sands
In the morning gleam as the tide went down,
And the women are weeping and wringing their hands
For those who will never come home to the town;
For men must work, and women must weep,
And the sooner it's o'er, the sooner to sleep;
And good-by to the bar and its moaning.—Charles Kingsley.

THE CAT THAT KILLED CARE.

The most characteristic feature of Mrs. Roswell's countenance was the deep,bow-shaped line that indented her forehead just above the bridge of her not at all remarkable nose.

Her maiden sister. Georgiana Keith, bore the same distinguishing mark, and it was likewise reproduced, in slighter degree, on the youthful brows of Mrs. Roswell's two daughters, Elizabeth and Dorothea. All four were what Mr. Roswell called "born worriers," and Mr. Roswell's name for the bow-shaped mark was "Mother Keith's anxious pucker," because his mother-in-law possessed the depest "anxious pucker" of all, since her's was the monument of seventy years of unmitigated worrying.

Yet at the time of this tale Mrs. Roswell was certainly the most active worrier of the entire quintet. It was that little woman's habit to worry for three months about the spring house-cleaning, and actually to accomplish the dreaded task in less than three weeks. She worried for two nights and a day over the concocting of a cake that really required less than half an hour for the baking. She worried for weeks over discharging a cook, when the actual deed could be accomplished in rather less than two minutes.

"Now, Mary," Mr. Roswell said on one occasion, when his wife confessed that she had worried all night over the problem of using up an overlarge roast of beef, "you've been in a bigger stew for twenty-four hours than you can ever hope to make of that meat. If you can't get it off your mind any other way, you'd better go down stairs at once and put it on the stove—or in it. You do enough worrying over managing this one small household to run all the affairs of this country, and Russia besides."

"I know it's foolish," Mrs. Roswell had replied, "and I don't mean to worry, but I can't help doing it."

Why a certain lean, homeless, neglected half-grown cat with a tremendous craving for human sympathy should have selected the Roswell cottage for a permanent home is one of the things that are past finding out. Mrs. Roswell, her mother, her sister Georgiana and her two daughters had always felt that they had enough to worry about without acquiring a cat.

But the Roswells had nothing to say about it. The cat claimed them as his own, and refused to give them up. He was not a prepossessing pussy. His fur was dingy and matted, his paws were stained with mud, and his long, extremely slender tail, had a curious spiral twist some inches from the tapering end.

But never was there a more loving, more demonstrative cat. Henry, as they finally called him, cuddled in all the Roswell laps, leaped to all the Roswell shoulders, twined himself tenderly about all the Roswell ankles. The affection, however, was all on Henry's side. No neat and tidy Roswell could bring either himself or herself to the caressing of such a decidedly unkempt creature.

"Dear me," said Mrs. Roswell, "that cat is so dreadfully grimy that it isn't possible to tell what color he is. He must have lived in somebody's coal bin before he came to us."

"He has licked one leg quite clean," said Elizabeth, dislodging Henry from her lap. "He seems to be yellow, with a pinkish cast, like Aunt Georgiana's changeable silk waist."

"He's just the shade of maple frappe," observed Dorothea, hastily tucking her ankles under her to save them from the sinuous caresses of demonstrative Henry. "Just think of owning a maple frappe cat!"

"I've been worrying for five days," said Mrs. Roswell, "about that animal. He must be washed, but how in the world can the thing be done? I've never washed a cat."

"You mustn't think of doing it!" cried Grandma Keith. "Some cats go perfectly mad with terror at sight of water."

"Yes," said Elizabeth, "I know it's dangerous. The Millards washed their Angora cat, and Grace was scratched clear to her elbows."

"We'll have to send the poor thing away," declared Mrs. Roswell, drawing her skirt from under Henry, who was settling down for a nap. "He has already caught three mice and two rats, and I'd rather like to keep him if his fur was only decently clean, but he does look too disreputable for words."

"If you'll give him time," said Mr. Roswell, kindly permitting Henry to lick his shoe, "he may get himself clean."

"He can't!" declared Dorothea. "There's more of him to wash than there was last week, and he wastes all his best licks on us."

"He has nice eyes," said Aunt Georgiana. "His manners are certainly ingratiating and his craving for affection is almost human. Do poke him a little with your foot, John . He is so hungry for a little appreciation."

Mr. Roswell poked. Henry instantly responded with a deep, sonorous purr.

Mrs. Roswell, her mother, her sister and her two daughters worried considerably about the feeding of Henry. They even wrote to a woman's magazine to ask how many mice a middle-sized cat should be permitted to eat in one day, and if rats would injure the digestion of a pussy of tender age. But, above all, it was the problem of giving Henry a much-needed bath that brought the deepest wrinkles to all the Roswell brows.

Henry, in a dry state, was a peaceable, thoroughly good-tempered cat. Henry, wet, might prove a veritable demon. He certainly cried aloud for at least one bath, yet who of all the Roswell's would undertake to bathe a soiled, maple frappe, half-grown cat?

"Not I," said Grandma Keith.

"Nor I," shuddered Elizabeth.

"Nor I," echoed Dorothea. "It's a pity we can't send him to the steam laundry to be mangled with the sheets."

"Or," said Mr. Roswell, "to the Chinaman to be starched with my shirts. Perhaps Bridget—"

"Sure, and I'll not!" declared Bridget, when approached. "You never can tell what mischief a wet cat will do."

"But," argued Mrs. Roswell, "somebody will have to wash him. Suppose we draw lots—"

"Will you do it," queried Mr. Roswell, "if the lot falls to you?"

"No," admitted Mrs. Roswell.

"They're a nice lot, aren't they,

Henry," said Mr. Roswell, "to be so afraid to wash one small harmless yellow cat?"

"O John! Will you—"

"No, ma'am! I washed a cat once—once was enough for me. Why don't you send to the hospital for a trained nurse?"

This suggestion was made in fun; but later in the day Mrs. Roswell was reminded of it. She had gone to visit a sick neighbor, and in the goodness of her heart, had offered to sit with the patient long enough for Miss Ball, the nurse, to take a little run in the fresh air.

"Thank you very much!" said the girl, returning half an hour later with glowing cheeks. "I feel lots better for my walk. I'll do as much for you some day."

"Did you ever happen to wash a cat?" asked Mrs. Roswell, suddenly remembering Henry.

"Lots of times. We used to own a white one that had to be scrubbed twice a week because she would sleep in the coal-scuttle."

"Would you—wouldn't you—would you——" began Mrs. Roswell, her anxious pucker deepening suddenly, "would you——"

"Would I wash a cat for you? Why of course I would—if—if it isn't a very fierce cat!"

"Oh, Henry isn't fierce when he's dry," returned Mrs. Roswell. "He's remarkably sweet-tempered. But we're so afraid water will alter his disposition that we've worried for three weeks over the problem of washing him."

"I'll come over at ten tomorrow," promised Miss Ball, "to take a look at him. Have a foot-bath and some good common soap and plenty of hot water ready in a warm room. If he looks at all promising, I'll tub him."

The assembled Roswells, fairly shivering with excitement, stood in a circle in the kitchen the next morning while Miss Ball tested the water in the foot-bath with her thermometer. Then she gently disengaged Henry from Elizabeth's ankles, and lifted him into the tub.

Grandma Keith backed into the pantry, Aunt Georgiana fled hastily up the back stairs, and the others shrank against the wainscoting, to make ample room for the flying leap of a frantic, dripping, revengeful cat.

But there was no leap. Instead, Henry deeply grateful for such an unusual amount of attention, sat up and purred while Miss Ball rubbed every scrap of him with soap except his contented eyes. Then she rinsed him with gentle showers of clean warm water, and Henry, sitting knee-deep in the pleasant flood, purred louder than ever.

"And to think," said Dorothea, who held Henry, still purring, wrapped in a shawl before the grate to dry, "that this whole foolish family worried for three weeks over washing a cat that would rather be washed than not! Just see how proud he is of his nice white paws."

"Yes," returned Mrs. Roswell, whose brow was smoother than it had been for many days, "all my worries turn out just that way; but I don't believe I shall ever be able to worry again without thinking of Henry sitting up in that tub and purring with all his might and main. Nothing ever made me feel so foolish."

"Then this," said Dorothea, twinkling, "may prove to be the cat that killed care."—Youth's Companion.

MEXICAN FRIJOLE SOUP.

Pick over and wash well 1 pint haricot or brown beans, put into cold water to cook; after boiling slowly for 10 minutes, drop in a piece of soda about as large as one of the beans and allow to boil five minutes more. Turn into colander and pour cold water over until the soda water is well rinsed off. Put back into the kettle, put on more cold water and let boil for an hour. Put in some bits of fresh pork, slice a good sized onion thin, put in and let boil until the beans drop to pieces. Season with salt, a dash of cayenne pepper and thin with a pint of cream or rich milk. When done it should be of the consistency of thick gruel. Serve with bread sticks or crackers. If pork is not liked, put in butter size of walnut with the milk. This takes about two and a half hours to cook. The recipe is given is for a family of six. Try it.

Get Oversize Tires

Avoid Blow-Outs—Save Overloading

Goodyear No-Rim-Cut tires—10% oversize—cost no more than tires that rim-cut, or tires not oversize.

The sale of Goodyear No-Rim-Cut tires has multiplied six times over in the past two years. Over 600,000 have already been sold.

Sixty-four leading motor car makers have contracted with us for these tires. The demand from users is now so great that our mammoth factories run night and day.

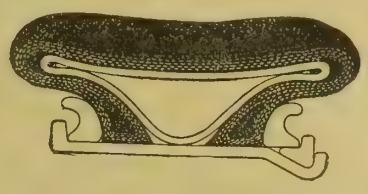
This patented tire has become the sensation. It is saving millions of dollars to motor car owners. It is a tire that you should know.

No Hooks—No Bolts

The No-Rim-Cut tire has no hooks on the base. No tire bolts are needed to hold it on.

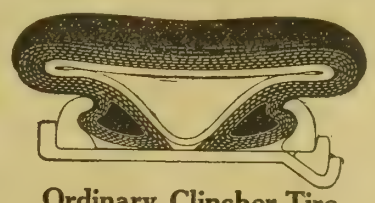
Into the tire base we vulcanize flat tapes made of 126 braided wires. These make the tire base unstretchable. The tire can't come off because nothing can stretch it over the rim flange. But when you remove one flange, the tire slips off like any quick-detachable tire.

This braided wire, flat tape feature is controlled by our patents. It is the only way known to make a safe hookless tire. That is why other tire makers still recommend the old-style clincher tire.



The No-Rim-Cut Tire

This tire fits any standard rim. Simply reverse the removable rim flanges—that is, slip them to the opposite sides. They will then curve outward, as shown in the picture above. The tire comes against a rounded edge, and rim-cutting is made impossible.



Ordinary Clincher Tire

In the ordinary tire—the clincher tire—the removable rim flanges must be set to curve inward. They must grasp hold of the hooks in the tire base, to hold the tire on. Note how those thin flanges dig into the tire when deflated. That is the cause of rim-cutting, which may wreck a flat tire in a moment.

10% Oversize

The No-Rim-Cut tire, where the rim flanges flare outward, can be made 10% over the rated size and still fit the rim. And we give you that oversize without extra cost.

That means 10% more air—10% greater carrying capacity. And that, with the average car, adds 25% to the tire mileage.

This oversize takes care of your extras—top, glass front, etc. It avoids the overloading which causes blow-outs on nine cars in ten which have skimpy tires.

These two features together—No-Rim-Cut and oversize—will under average conditions, cut tire bills in two. Yet these tires cost you nothing more than other standard tires. Do you wonder that men who know these tires insist on getting them?

GOODYEAR
No-Rim-Cut Tires

Our latest Tire Book, based on 12 years spent in tire making, tells many facts which motorists should know. Ask us to mail it to you.

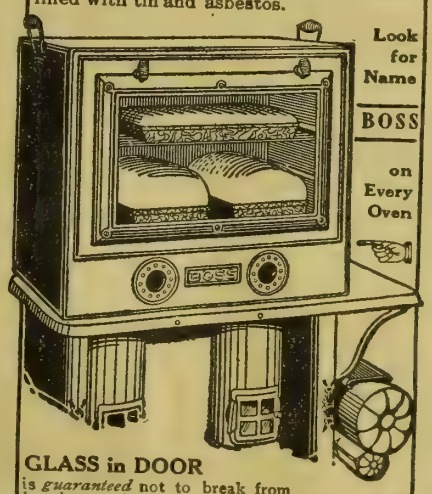
USE A PORTABLE
BOSS OVEN
With Patented **GLASS DOOR**

on *your* stove or range, either oil, gasoline, acetylene, alcohol or gas.

No more spoiled bakings or worry—No more wasted heat—No more jarring or chilling of oven. Housewives can see their baking without opening door. Economy and convenience both guaranteed in the BOSS—a polished blued steel oven lined with tin and asbestos.



GLASS in DOOR

is *guaranteed* not to break from heat because it is secured by our patented *yielding pressure* retaining strips, which permit expansion and contraction. Glass door fits snugly in one-piece beaded front, and is held tightly in place with two turnbuckles, preventing escape of heat.

Baking qualities and ventilation superior to any other oven or range. All heat goes right into the open bottom, and is perfectly distributed to all parts of the oven by means of our patented Heat Deflector. Flame always visible through small mica windows. With the BOSS a baking costs *less than a cent.* It will many times over *pay for itself* in saved bakings to say nothing of saved fuel.

Ask YOUR Dealer to show you the BOSS Glass Door Oven. INSIST upon seeing the name "BOSS" stamped in the front of Oven. Then you know that it is genuine and *guaranteed.*

FREE: Our valuable Recipe Book, containing many cookery helps and full description of BOSS Ovens sent FREE on receipt of postal, plainly written, giving your own and your dealer's names and addresses.

Extracted dark	6½
Beeswax, lb	24@30

Hay.

Scott, Magner & Miller say:

Arrivals of Hay during the last six days have amounted to 2100 tons; this shows a further decrease over the past several weeks. All offerings of hay have moved off remarkably slow, excepting something strictly fancy.

Practically the entire amount that we have been receiving has been of the old crop. No horse hay of the new crop has been moving into the market as it is not being sought at the present time for the reason that there is so much old hay available which the consumers prefer. Harvesting is in active process, and considerable baling has already been done, and it is now thought that the quantities will be heavier than anticipated.

The shipping of hay on export account has been light, and there has been no demand in any direction to take any quantity of hay to relieve the situation here.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	13.50@14.50
No. 1 wheat or wheat & oat	11.00@12.00
No. 2 wheat or wheat & oat	10.00@11.00
Choice tame oat	10.00@12.50
Other tame oat	8.50@10.50
Wild oat	9.00@10.00
Stock hay	6.00@8.00
Alfalfa	9.00@10.50
Straw, bale	40@50

Grain.

Barley, fancy	1.28¾@1.30
Barley, good to choice	1.25@1.27½
Oats, white	1.50@1.60
Rye, new crop	1.42½@1.50
Mustard, brown	5½
Alfalfa seed	5½
Millet	3@3½
Flaxseed	5@5½
Broom corn seed, ton	25.00

Feed Stuff.

Alfalfa meal	14.00@15.00

Feed cornmeal, ton	33.00@34.00
Cracked corn	33.00@34.00
Rolled barley, ton	28.00@29.50
Rolled oats, ton	29.00@30.00
Middlings	32.00@34.00
Oil cake, ton	40.00@41.50
Cocoanut cake, ton	25.50@26.50
Mixed feed, ton	25.00@27.00
Shorts	28.50@29.00

Deciduous Fruit Market

Sacramento, June 17, 1911.

Manager McKevitt of the California Fruit Distributors reports:

The following gives number of cars of deciduous fruit shipped from all points in California for the week (seven days) ending Friday morning, June 16, 1911:

Cherries—43¼ cars: Shipment of this fruit from the early section is finished, supplies coming almost entirely from the Santa Clara Valley at the present time. A considerable volume of shipments from that section will continue for the next week or ten days.

Apricots—16¾ cars: Royal apricots are moving in considerable volume now and shipments of this variety will continue to increase for the next two weeks. From this time forward we will have abundant supplies to meet all shipping requirements, although, as is well known, the crop of apricots in the early section is very light this year. Fruit is coming principally from the Vacaville and Winters section.

Peaches—3½ cars: Alexander peaches are now ripening rapidly. The first few boxes of Triumph have already made their appearance. Next week will nearly finish the Alexanders and should show a considerable volume of Triumph, which is our earliest yellow peach.

Plums—3½ cars: Clyman constitutes the principal variety of plum now being shipped. The first few scattering crates of Tragedy, Burbank and Climax are now going out from the early sections. All varieties will be more plentiful next week, and the heavy plum movement will probably be in full swing within the next two weeks.

The outlook for pears and grapes continues to be all that could be desired. Pears are growing rapidly and the grape crop never looked better than it does at this time. Bunches are large and well formed, berries are well developed for the stage of growth, and unless the unexpected happens this crop will be as fine as was ever harvested in the state.

Weather: Weather conditions are now ideal.

Citrus Fruit Market

Los Angeles, June 21, 1911

Oranges are stronger and lemons are weaker. The orange market is looking materially better than a week ago, caused in part by the cleaning up of Navels and other of the earlier fruits. Strictly fancy Valencias are now selling so as to bring $2.75 f. o. b. California, but such sales are the exception and the usual run of the Valencia cars will net not far from $2.25. Even the auction markets feel the impetus of the improved trade and good sales are universal.

A bit of disappointment is felt amongst lemon growers at a decided falling off in the lemon demand; this just preceding the Fourth of July trade was not anticipated, but the weather has taken a change toward the cooler, more favorable to humanity and less so to the lemon trade. In addition imports have been strong in anticipation of the big prices. These circumstances have resulted in the loss of approximately $1.00 a box. While that means much to the grower there is still a good showing for $4.00 to $5.00 f. o. b. Eastern points is now obtaining instead of $5.00 to $6.00 as in the past two weeks.

Shipments.

Shipments of oranges to date since November 1st, 1910: 31,416 cars; lemons, 4,661; total, 36,077. To same date last season: Oranges, 21,893 cars; lemons, 3,093; total, 24,986.

THE EVIL OF WASTED EFFORT.

The poet, Walt Whitman, gives us in a single line, an understanding of the meaning and scope of evil:

"Nothing out of its place is good; nothing in its place is bad."

Here we can see at a glance that what we call evil in this world comes from a perversion of good, the right thing in the wrong place. Brought down to the common affairs of life, to the business of the farm, how true it is. Good work at the wrong time means wasted labor. Poor tools in place of right ones mean wasted labor.

A lack of order, care, a place for everything and everything in its place, means wasted labor. Live stock of a kind not fitted to the purpose of the farm means wasted labor. A poorly informed mind not knowing, and maybe not caring to know, the real meaning of the forces that it is dealing with means wasted labor. Badly constructed buildings where animals are forced to live in an unhealthy, unsanitary condition mean wasted labor.

And so out of this enormous sum of wasted labor, ignorance in place of knowledge, come the growing evils of a wasted soil, wasted opportunities and finally a wasted life, with but little to repay for the long years of toil it has cost.

It all comes back to things out of place. A lack of fitness. What a triumph of mind over matter, of human accomplishment, it is to be able to establish on the farm an assemblage of right things in their right places. A good word should be spoken for the humblest farmer who strives to this end.—Hoard's Dairyman.

CLOTHES MOTHS.

Woolens and furs may be kept from injury during the summer months by enclosing the same in air-tight receptacles, preferably in a perfectly tight chest made for the purpose, and placing in a shallow dish on the top of the goods some bisulphide of carbon, at intervals of three weeks, two or three times during the summer. The odor of a cedar chest, and of moth balls, may be repulsive to the insects, but does not kill. It is usually unsafe to allow woolens or furs to remain undisturbed a long time in an ordinary trunk, since as a rule such trunks are not moth-proof. Some owners of furs place them with cold-storage firms in our cities during the summer season, since the pest cannot work in a temperature below forty degrees Fah. In our own home we use a galvanized iron chest, two feet square at the ends, and three and one-half feet long. Six hooks on the cover serve to hold it tight to the chest. A chest of this size takes four tablespoonfuls of bisulphide at an application, and is not opened for three or four days after the liquid is placed therein. No light should be brought near bisulphide of carbon, as the gas coming from the same is explosive.—F. L. Washburn, Minnesota University Farm.

God made all the creatures, and gave
them our love and our fear,
To give sign we and they are his
children one family here.
—Browning.

He prayeth best who loveth best
All things both great and small;
For the dear God who loveth us,
He made and loveth all.
—Coleridge.

The two most engaging powers of an author are to make new things familiar and familiar things new.—Thackeray.

It is good discretion not to make too much of any man at the first because one cannot hold out that proportion.—Bacon.

Mountains may not have mouths and noses, but we have seen a mountaineer.

THEIR POSITION.

Bolden: Do you go in for society, Olden?

Olden: Well, Johnny has a gang, my wife has a set, and I have a crowd.—Harper's Bazar.

SUGAR BEETS.

(Continued from Page 746)

ranch No. 1 beets have been grown continuously for ten years, with only an occasional crop of barley. In 1901 the yield was 15.6 tons per acre for an average of several hundred acres. In 1909 it was 15.4 tons—practically the same. In 1910 due to favorable weather conditions this land produced an average of 19.6 tons from six hundred acres.

Since rotation is the life of the land it will pay all growers to give grave and deliberate consideration to the sugar beet. By growing this crop in connection with the usual bean, potato or grain crop the fertility of the land is maintained at a maximum for future handling.

Following beets the increase of other crops, with the possible exception of potatoes, is increased, greater yields than ordinary of from 25 to 75 per cent being the rule rather than the exception.

MAGNESIA-LIME.

(Continued from Page 733)

maximum content, and begin to suffer as soon as development begins, the change of color rapidly becoming acute. But planted in a normal soil, magnesia, comparatively little withdrawn from the soil by the tree and crop, accumulates, while the lime supply gradually diminishes, the trees slowly succumbing to the declining ratio of the lime, and showing for some time the mottled appearance.

But this matter will be settled by the growers themselves in a year or more, since enough of them have supplied lime to the soil of their mottled orchards, even should they desist now, to see what it will do to the trees.

SECTION LINES.

(Continued from Page 744)

or is this optional with the various owners?—Subscriber Orloff.

The law requires that the surveyor shall run the north and south lines according to the true meridian lines. After the land has been patented to individual owers, they can change the boundary lines to suit themselves.—E. L. P.

Business

VALUABLE INFORMATION.

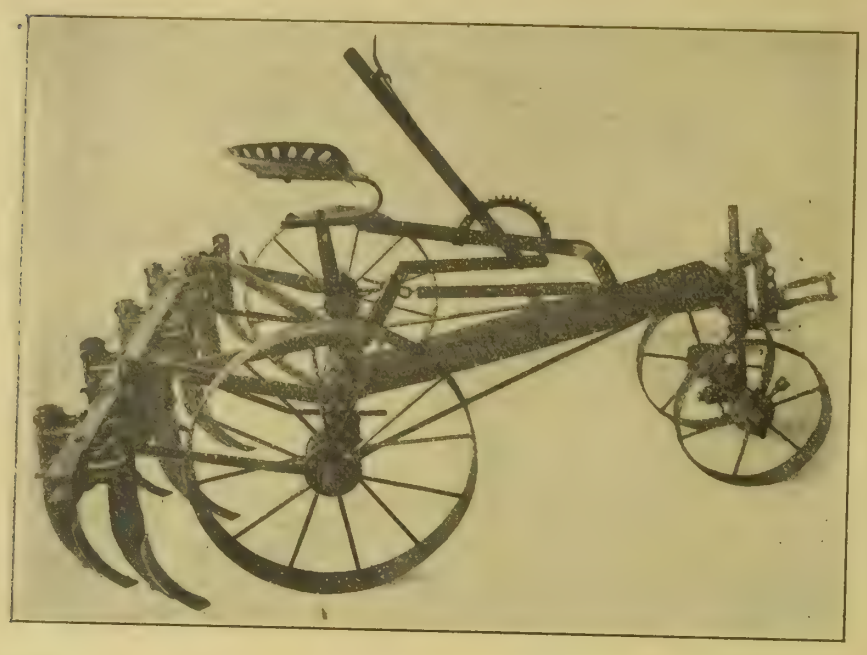
The Pacific Pipe and Tank Company of Los Angeles, San Francisco and Portland, is sending out a valuable booklet filled with information for engineers and all users of pipe for irrigation purposes. It will be mailed, if the Cultivator is mentioned, without cost to every irrigator who is interested. It contains only 24 pages, but is filled with much of interest in both text and illustrations. Part of the interesting information consists of ten reasons why the wood pipe is the most desirable to use. In the long list of specialties manufactured by this concern we note mining tanks, oil tanks, water tanks, wine tanks, gold storage tanks, vacuum settling tanks, and dozens of other appliances and complete plants.

The Junior Monarch Hay Press Company of San Leandro was established in 1865 and is permanently located in its new factory facing the railroad tracks between the Southern and Western Pacifics, and is shipping out a great many hay presses to all parts of the country. It is the largest hay press manufacturer on the Pacific Coast. Nearly seventeen hundred presses are now in use, giving general satisfaction. Its new improved power, which develops 30 per cent more horsepower than machines built formerly, is considered the best improvement made on presses in recent years.

The best day's run on record was made by Mr. Frank Rose, who baled eighty-two tons in one day, and King Brown baled sixty-nine tons in one day. These were made in adjoining fields, close to the Sacramento river, and were witnessed by a number of people.

Mr. F. W. King of Hawley, King Company, reports a good business. He states that up to date they have sold a total of 349 Southwick hay presses with particularly satisfactory sales of Buckeye Fertilizer Drills (now made to sow tankage), Deere Orchard Disc Harrows, and Flour City Gasoline Traction Engines—20, 30 and 40 H. P. The traction engine expert, direct from the factory, is for a short time making his headquarters at the store of the above named firm. Hawley King & Co. are also highly pleased with the many sales of 1911 models Oakland automobiles, a good proportion of which it is stated are being taken by prosperous California farmers.

The Arnott Improved Orchard Cultivator



WE are pleased to be able to announce that prompt shipments can now be made of the **New Arnott Cultivator** as shown above. This has been for years the most popular cultivator in the Southwest and with the **New Fore Truck** it is way in advance of any other orchard tool.

Sold by Leading Dealers everywhere, or write us direct if your dealer cannot supply you.

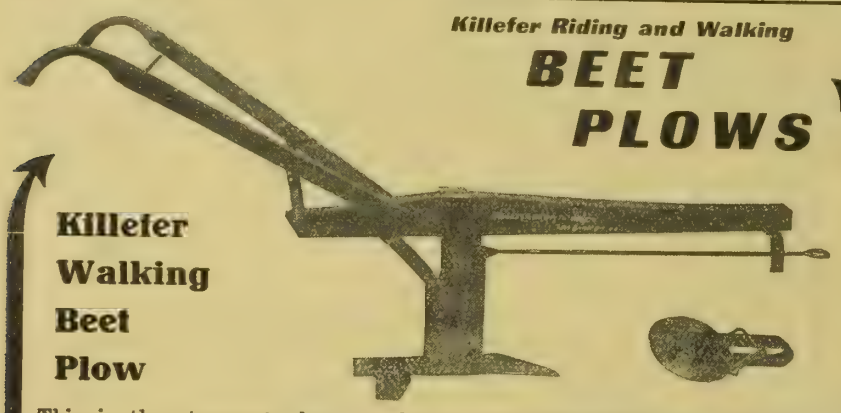
Killefer Riding and Walking

BEET PLOWS



Killefer Walking Beet Plow

This is the strongest plow on the market. Can be had with straight or offset standard, and has one piece land side. Nothing but hard plow steel is used in the Standard Shin Landside and point. Point and Shin are reversible. We guarantee this plow to do satisfactory work in any beet section.

Two Row Riding Beet Plow

It is especially adapted to large acreage, as it does double the work of single plows with but little more draft, and leaves the ground in fine condition for hauling off beets, as it does not throw up large clods.

The Standard Shin Landside Point and wings are made of very hard steel, which we have rolled for this work, and extras are always on hand for immediate shipment.

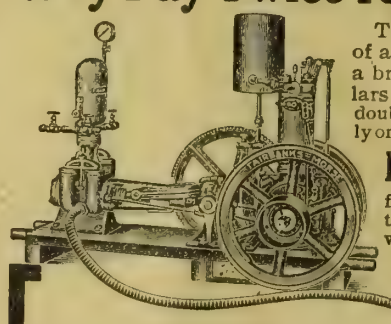
Both plows can be had with or without steering device. Write or call on us direct if your dealer does not have these tools.

Killefer Mfg. Co.

2210 Santa Fe Avenue
Los Angeles, Cal.

Tell us your troubles. We make special tools to order for handling special work.

Why Pay Twice for Your Spray Outfit?



The lack of sufficient pressure or the loss of a few days' time in spraying season from a broken-down outfit will cost you many dollars at the end of the season—more than double the cost of your spray outfit. Is it safe to rely on unknown outfits when you can get a reliable

Fairbanks-Morse Spray Outfit

for almost the same price? They put you on the safe side and insure your crop. Equipped with the well-known **Fairbanks-Morse** engine, they give an abundance of power and operate at the lowest cost. Then you can use this powerful engine for your work, such as pumping water, sawing wood, etc. Operates on gasoline, kerosene, distillate or alcohol. Outfit can also be furnished mounted on trucks with tower and tank complete.

Convention of the Pacific Coast Nurserymen

A Great Gathering at San Jose. Next Meeting Will be Held in Salt Lake City, Utah

On a typical Santa Clara Valley day, Secretary Brooks of the San Jose Chamber of Commerce, stood at the entrance of Saratoga Springs passing out individual cups to a bunch of Pacific Coast nurserymen. They all proved that they could drink water, and did so, for the waters of this spring are tasty and claimed to have medicinal qualities. Nor was this bunch of nurserymen all who were in attendance at that time, for hundreds of others, mostly from the valleys round about, were making a play day in the beautiful foothill sections which surround these springs. For the nurserymen this was one of the play days of a strenuous convention held in the city of San Jose. From Washington, Oregon, Idaho, Utah, Nevada, Montana and of course from California, and even from Vancouver, British Columbia, they came to discuss better business methods, and the growing of better nursery stock. We say it was a strenuous week, and every moment was filled, for the program which was given in the Cultivator of June 15th was followed out to the letter.

The play day mentioned and an afternoon spent at the grounds of the California Nursery Company were both most enjoyable and valuable as well, for the discussions entered into by members during these social times often bring out more information than do the set discussions of the formal sessions.

Mr. Eberly of the California Nursery Company proved himself as good a host as he was a poor speechmaker. Twice he was called upon to address the convention. and each time refused to comply, but in the complete meal which he placed before those visiting the grounds of the nursery company, he showed himself indeed a royal host. The best part of it was that every item on the bill of fare was a California product, at least so far as we saw in looking over the various edibles, from olives, grapefruit and cherries, to the sandwiches which we assume were made from California flour. The Shasta mineral water was likewise a California production, and it may be noted that those who did not like water were not compelled to drink it.

The first of these play day events in the week was made possible by the liberality of the Chamber of Commerce of San Jose. This body may be referred to in passing as one of the most energetic in the state in this, that it has just completed a campaign increasing its membership from something over 200 to over 2200. This was all accomplished within a ten day campaign which is the wonder of promotion bodies the world over. For the afternoon at the Niles Nursery Company's grounds Mr. Eberly acted as host, and the special train free to all delegates was supplied by the liberality of the California nurserymen and their friends.

The regular sessions of the convention were held in Odd Fellows Hall and the room was filled from start to finish of every session. Even the luscious fruits procured through the efforts of President Roeding, which were free to the attendants, were not sufficient to keep them away from the interesting discussions.

The best of feeling prevailed at all of these sessions, though at times much earnestness was manifested. This was particularly true on the day when Commissioner Jeffrey made his address. Nurserymen of this state have at times felt that county and state commissions were unjust in their enforcement of state and county laws, but more recently we believe a better feeling obtains and nurserymen realize that their own best interests are served not only by joining hands with those of the commissioners, who are competent, but by encouraging them in their work of suppression of pests and prevention of entry of others. The nurserymen's business goes and comes according to the profitableness of fruits crops, and the profitableness of fruit crops depends in large measure upon suppression of pests. But delegates from other states, especially those from Utah, are still in open rebellion at legislative control. We think perhaps from their statements they are in a way justified in their attitude. For example, the Utah delegates referred to a bill presented at their last session which aimed to control the shipment of nursery stock and in addition required all nurserymen to be placed under a bond of $10,000, which amount could be used in making good to any orchardist wronged through the purchase of trees not true to name. Nurserymen from that state boldly proclaimed that they could do their own inspecting far better than any county or other "bugologist." Mr. Jeffrey's address, however, stated the matter in such a way that we believe the general feeling of the delegates was that reasonable regulation should be encouraged.

This attitude was helped along by the address of John S. Armstrong of Ontario who maintained that the best results were accomplished by joining the authorities in the enforcement of the law.

The grading of nursery stock called for a thorough discussion which was presented by Mr. Breithaupt of Richlands, Washington. He raised the point that nurserymen in dealing with each other, and the people in dealing with nurserymen, were much confused with what "Number One," "Number Two," and "Number Three" stock might be. Some nurserymen grade their stock in this way and others grade "Two to Four Feet" and "Four to Six Feet," and still others grade as to height and caliper their trees. He appealed for the latter method as being the only sane way, for sometimes nursery planted stock will grow a six-foot whip of a tree which has small vitality and calipers little larger than a lead pencil.

Pedigreed stock came in for somewhat of a discussion, but some confusion obtained as to what pedigreed stock is. The discussion was not as interesting as it would have been had not one firm taken advantage of the interest in the subject to advertise itself. We believe that nurserymen should take up the matter of pedigree, but they should also consider that pedigree means something. The fact that buds may be taken from one tree which is known to be a good producer of good fruit, does not mean that they are pedigreed. Has the history of that tree been followed back for "generations," and what is its production under all kinds of conditions. A pedigree should only come after years of testing. Mr. Shamel in his work with Washington Navels at Riverside has dropped the word "pedigree" and is using the term "performance record." In the course of years these trees or their offspring will have secured a pedigree.

One of the interesting members on the program was "Rural Out of Door Adornment," by Johannes Reimers. landscape architect with the Western Pacific Railway. This paper with "Wild Flowers in California," and in fact a large number of other very interesting features, will be given in the Cultivator and the Rural Californian.

Plainly the nurserymen were brought into more sympathetic relations and a closer fraternal feeling obtained at the close of the session. A general enthusiasm was shown for high grade work and in suggestions for legislative and other action. The next meeting is to be held in Salt Lake City, Utah, and presumably during the month of June, 1912. The new officers elected are: P. A. Dix of Roy, Utah, President; Vice-presidents, C. F. Lansing, Salem, Oregon; A. W. McDonald, Toppenish, Washington, Charles Howard, Hemet, California; C. H. Smith, Centerville, Utah; Ray I. Hartley, Emmet, Idaho; J. D. Tighe, Billings, Montana; C. L. Trotter, Vancouver, British Columbia; Secretary and Treasurer, C. A. Tonnesen, Tacoma, Washington.

CONVENTION NOTES.

In the discussion regarding standardization of fruits, a Californian referred to various claims made, especially as to our nursery stock, and suggested that the safest way in advertising our claims for fine stock was for the various nurserymen to work to the end of pedigreeing and then standardize their trees, and meantime he suggested that it might be wise to "standardize our liars."

Some nurserymen suggested the advisability of a campaign of education of horticultural inspectors. After discussion, however, we think the opinion reached was that the education might be mutual. Certain it is the nurserymen left with a determination to work more in harmony with inspectors than they have in the past.

Some nurserymen find much embarrassment in competing with Japanese nurserymen. Many of them are most unreliable and tricky in their dealings with the trade which expects reliable firms to meet the prices made by the unreliable ones. Notwithstanding this, the fact was plainly stated that the only safe way for the nurseryman is to continue along the line of offering dependable goods at living prices.

Smudge pots in prevention of damage to nurseries have been found of less value than in orchards where they have materially raised the temperature and prevented frost injury. In the Northwest strawberry growers have made extensive experiments in an endeavor to save their fruit at blossoming time, and one attendant stated that these efforts had resulted in absolute failure. He considered the smudge pot or heating stove of no value for such low-growing crops. Mr. Roeding, however, maintained that great benefit had been secured from smudging in nurseries and creating a dense smoke just prior to sun-up. This he knew in one case had saved large quantities of nursery stock.

The question as to crown gall of apple trees being less frequent in budded than in grafted trees was answered generally in the affirmative, though some claimed there was no material difference. It was the unanimous opinion that inspectors had condemned trees for root knot or crown gall which were not affected. Trees showing an enlargement at point of joining of graft and stock are not necessarily affected with crown gall. At least several delegates asserted that they had seen such trees planted which made strongest and thriftiest growth and a large per centage showing healthy roots. The claim was that this was merely the enlargement caused by the healthy, healing tissue forming the union, yet such enlargements are almost invariably classed by inspectors as infections of fungus.

Prof. Wickson's talk on the nurseryman as an educator of the fruit grower was most informal. He referred to the public spirit manifested by many nurserymen in advancing the best interests of their home communities by educating the people to give greater beauty to roadsides and lawns by liberal planting of ornamentals. Especially did he refer to certain instances where nurserymen have given without price of their stock that their communities may be made more beautiful. None, he said. are drawn upon so heavily to meet requirements of public improvements. He spoke of the President of the Association as having literally donated miles upon miles of trees for street planting. Prof. Wickson paid tribute to John Rock, saying that this state was a great beneficiary of his life.

The Utah boys all extended the heartiest invitation to the members to meet in Salt Lake City next year and promised the time of their lives to all who would come.

Portland is working for the 1913 Convention. It is hoped that in connection with it will be held the annual meeting of the National Association of Nurserymen. If this should be brought about Portland will see a jolly bunch.

Luther Burbank was scheduled for a short talk but arrived in town too late to attend the session at which he was to appear, but he accompanied the nurserymen on their trip to Los Gatos and there delivered an address on the porch of the hotel. His talk was almost wholly in regard to spineless cactus, brought out by questions put to him by the members. In referring to his productions in hand which have not been given to the trade, he said that he had "more up his sleeve than ever have been sent out" and intimated that they would be of greater value than anything yet produced.

President Roeding's annual address was long and full of suggestion. From it we are able to quote at this time only a very few paragraphs regarding the possibilities of the association as follows:

"You have passed out of the period of swaddling clothes and are now on the highway leading to a stronger organization, which will ultimately count among its members not only the leading nurserymen of the Pacific Coast, but the recognized horticulturists who will assist in building up this great empire of ours, which although it stands today as the most important horticultural section of these great United States, is only in the infancy of its development. There is no institution that has not vicissitudes to pass through and our association has been no exception to the rule.

"It is due to the allegiance and perseverance of the nurserymen of Oregon and Washington, who held this organization together at all hazards, that our membership has reached a point where our strength will make us impregnable factors in dealing with horticultural problems.

"All the great irrigation problems of the day are being solved in these

BREAKING UP HARDPAN.

When at the San Bernardino Citrus Growers' Convention we heard Mr. Kenneth MacRae speak of the satisfactory work done by an implement intended to break up the "irrigating plow sole or hardpan" which forms in all orchards where irrigation is practiced. During heavy rains of winter this hard stratum a few inches under the surface disappears, and deep plowing at that time helps in keeping it away during the early part of the coming summer. Various implements have been constructed to aid in keeping down this condition, all requiring more or less power to manipulate. Mr. McRae claims for his implement, novelty and complete effectiveness. We recently wrote him and asked for a description, together with a photograph of it. The photo is not yet available, but the description as sent by Mr. McRae is so plain that we think it will be sufficient in aiding anyone else in its construction. The first suggestion in the letter is for the making of a model to give the blacksmith the proper conception of the plan. Mr. McRae says: "Take a paper mailing tube, insert six splinters at right angles through the tube; imagine the axle, frame and wheels, and you have it."

The description of the implement we think even plainer than the description of the making of the model. It is as follows:

"Mine is built by our blacksmith and cost less than $30. To construct it we secured a piece of double steel well-tubing, four feet long, twelve inches diameter. We cut suitable holes in the pipe to admit inch and a half steel bars. These were cut in proper lengths to pass through the pipe and project sixteen to eighteen inches. In other words, these bars should be forty-eight inches long. These are drawn to a point at both ends, clamped firmly and centered inside of the pipe. For transporting along the road, wheels and an axle are necessary, so I inserted a disused heavy buggy axle, which is offset to allow it to pass the steel bars and yet have the cylinder centered on the wheels. This done and the axle fastened in the center, place the cylinder on end, spike in place, and fill with a strong concrete or cement. Then make a frame same as for a roller with a pivotal wheel in front. Put on a seat for the driver, for you will need his weight. Of course in use in the orchard the wheels are removed. Hitch on two or four horses, according to the condition of your ground, and see the steel bars cutting through the hardpan and fixing the soil to absorb the next irrigation. Care must be used not to put too many spikes in. I made the mistake first of putting in seven rows. This did not work, because the number was sufficient to support the machine and the spikes did not penetrate the hardpan.

"I believe the decadence of our groves so much talked of at the Pomona Citrus Growers Convention is caused by nothing else than this irrigation hardpan. The years of constant cultivation have created a crust which allows neither water, air nor fertilizer to go through it. Deep cultivation, especially deep plowing or sub-irrigation, destroys eight-tenths of all the feeding roots where this condition obtains. I built this machine to meet this condition and break up this crust without the destroying of those feeding roots.

"On one twenty-acre grove which did not thrive as it should I used this perforation freely last winter. The grove has taken on new vigor, has much better growth, and is in a better condition as a result. The ground readily takes twice the amount of water and makes cultivation more effective. Now, if some clever man will build one that will both prod these holes and deposit a column of sand, it will be a lasting cure. Any Cultivator readers are at liberty to have these machines built, or to use the idea with such improvements as they may suggest themselves.

"Incidentally, let me refer to fertilizing. I have used only cover crops and three to five pounds of nitrate of soda on 100 acres of groves for the past four years. The trees are looking fine, fruit is abundant, is firm and of good size. My yearly fertilizer bill used to be about $4,000; $1,000 to $2,000 pays it now. Would like to have Cultivator readers try this plan on a few rows, or say five acres. Try five pounds of nitrate of soda per tree on a few rows and put twenty to thirty pounds commercial fertilizer on the balance."

THE VALUE OF GREEN MANURES.

It is a well established fact that the soils of the arid regions are as a rule deficient in organic matter. This deficiency may be overcome to a certain extent by any of the three common methods of adding organic matter to the soil, which are as follows: (a) By green manures and crop residues; (b) by accumulations in pasturing; (c) by applications of farm manures.

Of the methods mentioned, the first is the most important and least practiced. It consists mainly in the growing of a crop which is plowed under while it is green and succulent, as it decomposes most readily at that stage. Dr. Cyril G. Hopkins, of the Illinois Station, in comparing green manures with farm manures, makes the following significant statement: "As an average, animals digest and thus destroy two-thirds of the dry matter in the food they eat, so that one ton of clover hay plowed under will add as much humus to the soil as the manure made from three tons of clover hauled off and fed, even if all the manure is returned to the land without loss by fermentation."

Leguminous crops, such as alfalfa, clover, field peas and vetches, are usually recommended for green manures. They have the special power of obtaining their nitrogen from the air through the agency of bacteria inhabiting the tubercles on the roots. Any of the above crops can be grown in the soils of the arid regions.

The characteristic advantages of green manures to the soil are as follows:

1. Increases its fertility by the large amount of organic matter which it acquires.
2. Increases its water holding capacity.
3. Utilizes soluble plant food that would otherwise escape from the soil.
4. Brings plant food from the lower soil to the surface soil.—Jas. D. Marshall, Colorado Agricultural College.

FERTILIZING ORANGES.

Sometime ago we requested Prof. J. H. Norton of the agricultural experiment station staff, in charge of the citrus experiment station at Riverside, to give to us formula for a fertilizer for citrus trees, the amount which would yield greatest percentage of profit, and while we realized in asking it the varying conditions which would affect results, we hoped for just what the Professor has sent us, his general idea. Fertilizing requires more intelligent consideration of general conditions than almost any other factor in farming, and he who would intelligently apply good coin to his soil in the form of fertilizer should make thorough physical examination. The chemical examination has much of value, but the farmer who sends a package of soil to a chemist and expects a reply stating just exactly what to do to secure good crops will doubtless meet disappointment. As a suggestion, we give herewith Prof. Norton's reply:

"I think of fertilizing as adding a definite percentage to the yield of the crop and the heavier the application of the fertilizer the less the percentage. Then it comes back to the value

Fruit growing sections of Boise, Idaho, are showing a good crop in spite of damage feared from the early frost.

of the crop per acre as to how much fertilizer it is profitable to apply.

"I am trying to follow the practices of our most practical citrus growers as to their methods of fertilizing and from all I can gather I use in general as a basis to work from the following amounts of the three elements per acre for citrus groves: 125 pounds nitrogen, 250 pounds phosphate and 120 pounds potash.

THE OLIVE INDUSTRY.

While the olive industry in California was rather neglected for a few years, new life seems to have been given to it during the past year or so. A number of old orchards were cut down, and oranges or walnuts set out instead, but there is now a strong tendency not only to revive some of the older orchards, but also to set out new ones. The pure food law had some influence in this change, since formerly many of the producers of pure olive oil could not compete with the low priced product which contained a high percentage of cheap cotton seed oil. Furthermore, the only olives formerly sold in the eastern markets were the green pickled ones. The ripe olives have long been used on the Pacific Coast, but they had never attained popularity in the East, because they did not carry well and usually reached the eastern markets in poor condition; but since it has been learned that the ripe olive can be scientifically canned and shipped to any distance, arriving at its destination in perfect condition, the industry has received a new impetus.

In the establishing of new orchards as well as the rejuvenating of older ones, there is no question of more importance than that of the fertility of the soil.

In the earlier days of fruit growing in California the erroneous idea prevailed, and remains to some extent to this day, that the olive tree may be planted where no other fruit will thrive and that it needs little or no cultivation or fertilization. Under this idea many fortunes were wrecked in olive planting and much discredit brought upon the fruit as a profitable industry.

While it may be true that the production of the olive fruit alone does not draw heavily on the resources of the soil, nevertheless, to insure a satisfactory growth of tree, leaves and wood, the following amounts of plant food are required annually: Potash, 83 lbs. per acre; Phosphoric acid, 35 lbs.; nitrogen, 86 lbs. A mixture to provide, approximately, these ingredients would analyze: Potash 8 per cent, available phosphoric acid, 6 per cent, nitrogen 4 per cent.

This mixture should be applied in the early spring and worked well into the soil with the aid of a fertilizer drill, or by broadcasting and turning under with a plow or disc harrow.—D. I. D.

"NEFARIOUS WORK."

Lord Bacon, more than three hundred years ago, said: "There be three things which make a country great and prosperous—a fertile soil, busy workshops and easy conveyance for men and things from one place to another." Now the soil and its fertility is in charge of the farmers of the country; the workshops are in charge of the manufacturers, and the "easy conveyance of men and things" are in charge of the railroad companies in the main.

Suppose the manufacturers so handled their workshops as to constantly decrease their power of production, or suppose the railway companies allowed their tracks and cars to go to pieces, would we not hear a big howl from the farmers declaring that these two other partners in the country's destiny were lacking in patriotism and demanding the force of law at once to stop their nefarious work? Of course we would.

Well, what shall be said of us as farmers, when we deliberately destroy by our lack of knowledge and skill, the fertility of our soil on which depends at least one-third of the country's future greatness and prosperity?

Are we not lacking in patriotism Should not the force of law take hold on us and compel us to stop such "nefarious work?" Are we standing by our country as we should?—Hoard's Dairyman.

WEBER WAGONS

It was in 1845 that the first Weber wagon was built. From that day to this every effort has been made to build them the way the farmer wants them. Think of it—sixty-three years of steady advancement. It is no wonder that they are known as "King of all." Every element of excellence in wagon construction is embodied in the Weber. The best quality of material is used; it is properly constructed, and attractively finished.

Deciduous Fruit Culture

MARKETING FRUIT IN STANDARD PACKAGES.

That California is not the only section needing to send out an honest pack of fruit is shown by the following communication appearing in the Gleaner:

Why was it necessary to establish and to constantly and sacredly protect, a standard value of money? It was so that every person who uses it would be assured his rights in the channels of business, and that the poor man's dollar should cover as much surface as that of the rich man; in fact, to establish two fundamental bases; viz., quality and quantity. Why then, is it less necessary or important to establish a standard of weights and measures for the protection of consumers who are daily and hourly forced to spend their dollars for the commodities of life? Go where we may and purchase where we will, we find a miscellaneous lot of barrels, packages and containers purporting to contain such parts of the standard bushel as pints, quarts, pecks, and half bushels, when, in truth, they are deceptive from start to finish. For instance, take the commercial bushel basket as is generally used by fruit growers in the marketing of fruits. They are made so as to look like a bushel, but they hold much less. To prove this, weigh up 60 pounds of potatoes and try to put them into one of the socalled bushel baskets and note results. They hold from 45 to 50 lbs. when well heaped, and no more; yet nearly all merchants make their deliveries to the consumer in these snide bushels, while in their purchases from the farmer they exact 60 full pounds per bushel, or, the standard crate measure; and more than this, woe to that consumer who buys in lots less than bushels, as the average merchant is awake to dodge the law and to skin his patron, said merchant always figuring to make every bushel of produce purchased to measure out five pecks instead of four—and the consumer pays the bill. How is this done? Note that measures used by most merchants are made of metal, made tall and with corrugated bottom. Being short in diameter, and tall, what is the result? It is this; that in buying a peck of apples or potatoes one gets but little more than a half peck, or with the tall half bushel the purchaser would get but little more than a peck, due to the singular construction of the measure. But should it be beans or peas or any of the grains that one wished to purchase, and one could get them measured to him with said measures, results would be different, as then one would get what he called for; but mind you, merchants sell beans, rice, peas and other grains only by weight; they then looking to their scales to do the work, knowing that the measures are government scaled and can't be doctored, while the scales can be made to vary from correct amounts. This intimation is not aimed at the merchant who deals out justice with his goods, but rather to that vast army of pretenders whose conscience wears a rind impenetrable to the chidings of honor. Take again the common quart box, as used for berries. If filled with flour, meal or bran, they would hold a legal quart, but when filled with berries, cherries or damson plums it would require at least forty of them to make a standard bushel; thus the consumer is out the eight boxes of fruit necessary to make the amount, as 32 quarts constitutes a legal bushel.

Short weights and measures, unless so marked that consumers may plainly see and know what they are getting, spell nothing short of theft. The writer is a fruit grower and shipper and speaks from the standpoint of actual experience concerning the ever changing forms of fruit packages, but, strange as it may seem, we have never, in our 38 years' experience, known of a package being made too large. Of course, the law plainly declares as to the length of stave, the required bulge and the diameter of head required in the standard three bushel apple barrel; but to dodge its use as a standard package another smaller barrel is made, and these dubbed as pear barrels, but entirely too often used as apple packages. This is fraud, pure and simple, unless some mark goes with the package plainly denoting its shortcomings, as this so-called pear barrel is fully one peck short of the standard for apples.

Nothing tends more toward the depreciation of a season's crop or the depression of markets and curtailment of consumption than does dishonest packing, "short" packages and the many irregular shapes and forms of containers that are being sent to market. Who among us could question the absolute fairness of adopting as a standard, for example, a full bushel, and then being obliged by law to mark all packages that contain less, either as "short bushel," "short half," "short peck," etc., thus would the consumer be put on his guard in making his purchases, as would also the full grown and all man producer be protected against the snide packer who insists on advertising to the world the size of his selfish soul as is represented in his deceptive package. We need no better index to a man's life than is found in his works. The bigness of his heart, as well as its smallness, can be easily figured from the handwriting that he daily places upon the wall through his dealings, and just so soon as his reputation is branded with the word "short" by his neighbors, then that unwholesome word "suspicion" is permissible.

We are living in an age of strenuous competition, and this has consequently led us into bad company, creating as it does a lot of small, petty deceptions which would be frightful could they be held up against us in the broad courts of honor. The finger of shame is now being turned toward the farm, and just so soon as the pure food commission gets through with the dirty work they now have on hand, then will their vials of wrath be poured out upon the heads of those among us who deserve the exposure. Can we expect to continue to engage in the honorable business of production and hope to remain immune from attacks of an exasperated and outraged public of consumers if we persist in dwarfing our calling through fraud? Is it not better for the farmer and fruit grower to aid in uncovering the rot among us than to have it sprung upon us by the consuming public? Yes, a thousand times, yes! God deftly paints the lily and the rose—spins the blush upon the apple and the peach and tints into gold the waving harvests of the world. We are His agents, distributing to the people from His bounties! Will we displace and belittle that blush and gold by placing in its stead the blush of shame? By all means, no! Let us work toward the standardization of measurements, and then strictly adhere to them. Give an honest bushel, and stand for an honest bushel in return.

STANDARDIZATION IN SACRAMENTO VALLEY.

Answering query as to the situation in Northern California in the matter of standardization, Mr. Marshall De Motte, of Shipaulovi Ranch, at Corning, writes:

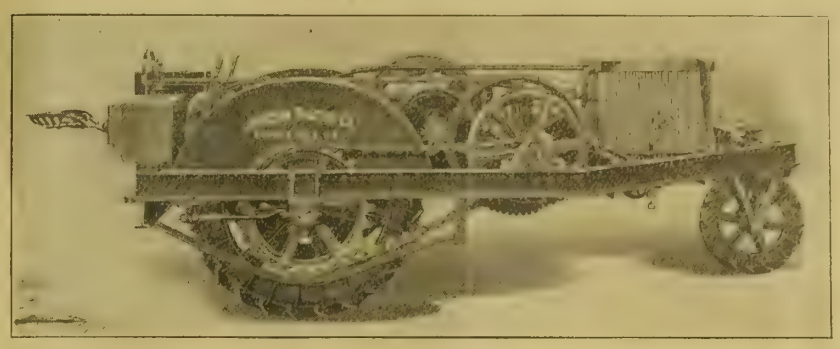
"Standardization of fruit pack has come to stay in the deciduous fruit districts in the northern part of the state. The very wise and careful work of our state horticultural commissioner, Mr. Jeffery, in the plans which formed the basis of the movement, has been proven in a year's trial to be well nigh perfect. In some instances communities are changing their standards slightly for this season, but this is generally for the betterment of the quality. One noticeable feature is the absence of opposition in almost every place, and where opposition has occurred it has been easy to persuade the opponent that he would do best by uniting with the forces of this advanced movement. I recently heard men from several districts say that through the working of standardization for one year they felt that the fruit business in their localities had

The Most Successful Tractor for Farm and Orchard

Use is the One Simple to operate and Simple in Construction

Mr. Farmer, Mr. Orchardist:

You will agree with us that the better you can till the soil, and till it when it should be "which is usually when it is too hot to get best results with the horse" the greater your profits will be.

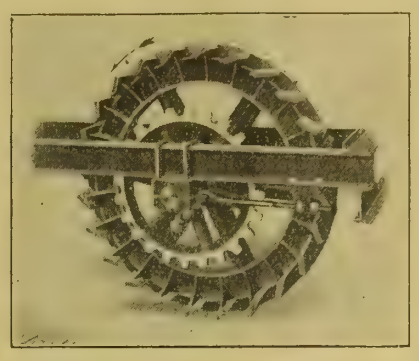


Have You Stopped to Consider

What it costs to plow, cultivate, etc., with high priced horses working them 90 days and feeding them 365. True, until the present you have had no alternative, but the JOHNSON TRACTOR is especially designed to meet the requirements of the FARMER and ORCHARDIST.

Our 40-Horse Tractor

Shown herewith is especially adapted for GENERAL FARM PURPOSES. Pully for pumping, sawing, threshing, or any and all power purposes is attached on shaft where crank is shown.



We Want to Tell You

More About This Powerful Engine

and show you how it will earn you money. Our catalogue tells a story full of facts and figures of living interest.

Be Sure to Send for the Book Mailed Free

Our 30-Horse Tractor

While especially designed for orchard work, is equally efficient for general farm purposes, and for stationary purposes can not be excelled.

We call especial attention to our

Tractor Wheel

which gives the greatest possible traction, does not clog, slip or ball up, and no possibility of shaking to pieces like a built-up wheel, and best of all does not pack the soil.

Johnson Tractor Co., Sunnyvale, California

been so benefited that they not only were getting more money out of their orchards, but felt an appreciable advance in the value of their orchard holdings already. It was impossible to cover all the North last year, but it is significant that not a place has backslidden, and that this year new places are uniting with the movement. It is truly remarkable that the abuses that have grown into the fruit business in countless years should be wiped out by the careful planning of one man, who has been able to obtain and hold the co-operation of all who have joined the movement so far. The North extends to the South her congratulations that this most progressive movement is appealing to her also."

DIVIDEND NOTICE.

The German Savings and Loan Society
(The German Bank)

(Member of the Associated Savings Banks of San Francisco.)

526 California St., San Francisco.

For the half year ending June 30, 1911, a dividend has been declared at the rate of four (4) per cent per annum on all deposits, free of taxes, payable on and after Saturday, July 1, 1911. Dividends not called for are added to the deposit account and earn dividends from July 1, 1911.

CALIFORNIA NURSERYMENS ASSOCIATON.

California nurserymen attending the Coast Association meeting at San Jose met in the Chamber of Commerce rooms of that city Thursday evening. George C. Roeding was elected temporary chairman and Mr. Valance temporary secretary. The object of the meeting was stated to be the getting together of California nurserymen who are often unable to attend the Coast meetings which may be some hundreds of miles distant from their homes; in addition, state quarantine, growing of nursery stock, and other matters of a local nature seemed to make the formation of a state organization desirable. Almost everyone present at the meeting expressed the belief that the step was a wise one, and after discussing the outlines of a constitution and by-laws, and signing the roll expressing determination to become members, officers were elected as follows: President, W. V. Eberly; Secretary, H. W. Kruckeberg.

This state organization is not to antagonize in any way the Coast Association, and this was made plain in the wording of suggested constitution which stated that the affiliation should be the closest. In fact, membership in the State Association constitutes membership in the Coast as well; out of the $5.00 annual dues, $2.00 is to go for Coast Association membership.

As to time of meeting some favored the State Fruit Growers Convention usually held the first week in December. Others, especially the San Francisco members, felt that that was one of the busiest seasons of the year in getting ready for the Christmas trade. Decision was passed up to the executive committee.

ENTHUSIASTIC FARMERS.

It is only the men who are with the different classes of farmers that fully understand the depth and breadth of enthusiasm that is manifested among them. If we are with the dairymen there is a rich vein of enthusiasm on account of their ability to produce more and get an increased price for it. Dairymen are, seemingly, prosperous and happy.

If we are with the stockmen of all classes, there is a glow of contentment and satisfaction on every face, no matter whether it be horsemen, cattlemen, sheepmen, hogmen or poultrymen, they all have their stories of achievements and successes that are told to express their satisfaction and pleasure, and to win the admiration of the listeners.

In a meeting of fruit farmers there is the same spirit of pride and satisfaction in their business. They can tell of great crops of all kinds of fruits, excellent prices obtained for the same, and a sum total that astonishes listeners. They tell of dollars growing on their trees and vines, and will ask, "In what other business can one make money easier than in raising fruits?" The supply of fruit increases, the demand keeps pace with it, and an abundance for them in the future seems assured.

Let the good feeling abound. It is the farmers that garner from the soil the wealth of nations, and it should be their right to enjoy a goodly share of the results of their labors. In fact, the farmers are coming to their own and are entitled to enjoyment. Let us encourage it.—Gleaner.

There are two classes of strawberries, known as staminate and pistillate, or perfect and imperfect varieties. The staminate or perfect varieties all have well-developed stamens and pistils, the male and female organs of the flower. These varieties, as a rule, will bear fruit when planted by themselves. The pistillate varieties have only the pistils or female part of the flower. In order for these to bear fruit, it is necessary that perfect or staminate varieties be planted near them. Usually, where pistillate and staminate sorts are used, one row of staminate is planted to three rows of pistillate. Planted in this way, the pistillate varieties very often bear more fruit than the staminate. There is no way of distinguishing the difference between these varieties when not in flower, although there are certain characteristics of plant-growth that may enable one very familiar with the strawberry to distinguish varieties.

STAR Portable Drilling Machines

More Profitable Wells

Can be drilled with the right machine. In buying a Drilling Machine, the first vital point is to be sure it will yield you the greatest possible service—and hence the greatest possible profits. You ***must*** know.

Star Portable Drilling Machines

have stood the test for years in comparisou with all makes, and the very fact that fully 95% of all Portable Machines now at work in the Oil Fields are Star Machines is all the proof necessary as to their superiority for all kinds of Well Drilling.

O. J. WEBER 225-227-229 East 6th St. **Los Angeles**

THICK CREAM
Means Sweet Cream

The density of the cream from the United States Cream Separator is easily regulated by aid of the **patented cream screw.**

Many users produce cream testing over **60 per cent butter fat.**

Thick cream is a great advantage in hot weather because the **milk** which **sours first** is so nearly eliminated. Creameries pay **top prices** for such quality.

United States Separator

cream is in great demand at all creameries. Thick cream means less bulk to transport, but more skimmilk for feeding. United States Separators **hold world's record** for closest skimming. They are the **Standard Separators of the World.**

For your own sake don't buy a "cheap" separator or decide on any make until you have seen and tested the United States Separator. Get the large, illustrated U. S. catalog No. 20

Live Stock and Dairy

Dairymen and stockmen are requested to write of their experience. Mrs. Sherman is always willing to answer queries and this, with experience of other workers, will make this department of greater value.

FEEDING THE BREEDING HERD.

In feeding swine, the same as in feeding other live stock, food will produce satisfactory results only when fed in a ration that is properly proportioned, so that all the parts of the animal will be well nourished and the digestive system kept in a healthy condition.

Results of numberless experiments emphasize the fact that rations containing a large amount of ash and protein are better adapted to promote the growth and development of breeding swine than corn alone. However, the increased cost of concentrated protein feeds makes their use in large quantities very expensive, but fortunately it is easy to obtain these elements in an economical form by using proteinaceous forage and pasture crops and providing the swine with large yards and good grazing.

An ideal combination of feed for the breeding herd consists of clover, alfalfa and blue grass pasture, supplemented with a limited amount of grain food.

Skim milk is an excellent feed, and mixed with wheat middlings in the form of a thick slop makes an ideal food for breeding swine.

A small allowance of corn may be safely fed to brood sows and animals that are lacking in condition. In many cases where pasture crops and skim milk are not available, the protein problem may be solved by feeding a small amount of digested tankage.

Concentrates may be used with very good results, the chief point being to feed bone, blood and muscle building food and in the right proportions.

When pasture and green feed are not available, clover and alfalfa hay run through a feed grinder or cutting box and mixed with the mill feed in the slop will give the necessary bulk and succulence to the ration.

The value of bulky and succulent feeds is recognized by the most intelligent feeders. Succulence balances the effect against dry, concentrated feed; it possesses general tonic and corrective qualities and stimulates the appetite for a more economical consumption of the other feeding stuffs.

Bulky foods act as dividers and assist in the more complete digestion of concentrated foods. Succulence and bulk are furnished by such foods as forage crops, pasture grasses, roots, vegetables and similar feeds that are usually inexpensive, desirable and very valuable in feeding the breeding herd at all seasons of the year.

These succulent and bulky feeds have a loosening effect upon the flesh, and are excellent for the sow toward farrowing, as they overcome the tense condition of the muscles resulting from a dry grain diet.

If the number of the brood sows is considerable the feeding of high priced grain food cuts largely into the profits. The mature sow that is not suckling a litter of pigs does not require a large amount of grain feeds.

If she is provided with plenty of grass and forage crops she will thrive with but very little grain food. During late years the importance of having an abundance of pasturage and forage crops for the breeding swine is more and more apparent.

By setting aside a number of acres and growing proteinaceous forage and pasture crops the cost of feeding may be greatly reduced and the animals will be more thrifty and vigorous.

In planning a system of pasture and forage crops we should plan to have the ground growing some crop all of the time.

Rye for late fall and early spring pasture is unexcelled; this may in turn be succeeded by alfalfa, clover, oats and peas, sweet corn and rape, and rye again late in the fall.

The droppings from the swine will soon put the land in a state of excellent fertility, and there will be no filthy yards and mudholes for the swine to wallow in.

Many acres of poor land may be rejuvenated by growing proteinaceous forage crops and pasturing them down with the swine.

The droppings from the swine, and the nitrogen gathered by the forage-crops, build up soil-fertility rapidly.

In feeding the herd boar, the same principle holds good. Since the breeding boar represents as great a factor in breeding as thirty or forty sows, it is very much more economical to feed the one sire, than thirty or forty sows.

The breeding boar cannot be too well fed and cared for. He should be kept in good, vigorous condition, and in as comfortable quarters as possible.

Feed him only the kind of feeds that are adapted to his requirements, and vary the amount according to the services he is required to perform.

It is necessary to feed him with food that will produce lean as well as fat, and give health and superb vigor.

With such grain foods as ground oats, wheat middlings, oil-meal and very little corn, supplemented w such bulky and succulent feeds alfalfa, clover and peas or roots, will be strong, thrifty and serviceab for many years.

Succulence and bulk in his ration will prevent injury from overfeeding, and he will be much more contented than when he is fed a less bulky ration of concentrated foods.

The practice of confining the breeding boar in a small pen, and feeding him a ration of fat-producing foods cannot be too strongly condemned.

The character of the feed, impo tant as it is, is not the only thi that needs attention in the care the breeding boar. Give him plen of room for exercise, and if he do not exercise freely himself, take horsewhip and walk him around oc casionally.

Ordinarily, however, if he is given a good-sized pasture or yard, he will take sufficient exercise, without r sorting to this trouble.—Farm Worl

Cream Separators, all sizes and prices. O. J. Weber Co., 225-227-229-231 East Sixth Street, Los Angeles.

BIOLOGY OF THE TEXAS-FEVER TICK.

In order that eradication of the ca tle tick from the states below th quarantine line may be the more i telligently and successfully carri out it is necessary that it should based upon the most accurate kno edge possible of the life history, ha its, etc., of the tick.

With the view of supplying possib useful additional data relative to t biology of the tick, the zoological d sion of the Bureau of Animal Indus and the veterinary department of Alabama Polytechnic Institute h conducted a series of investigati upon the life history of the tick, its l its and the manner it is affected by matic and other environmental con tions; and this data has just be published by the Department as reau of Animal Industry Bulletin 130.

The work carried on during the six years by the Bureau of Animal dustry in co-operation with the s authorities has shown that the er cation of the cattle tick from the fected states is entirely feasible, its disastrous effect upon the cattl dustry of the South can be preve

The usual host of this tick is cow or ox, frequently, how horses, mules, deer, and some sheep serve as hosts, and mu considered in plans of eradic Hence, experiments were made ticks on some of these animals O. also upon rabbits, cats, dogs, and r But none of these, with the pos exception of deer are susceptib ed tick fever, consequently they s, from the tick as a simple pa and not as a transmitter of di s;

Only a part of the developm the tick takes place on the ho tion.

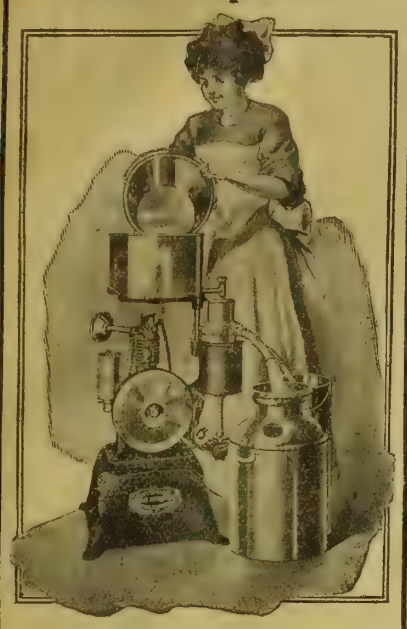
AUTOMATIC
Cream Separator



CRANKLESS
and GEARLESS

Nothing like it has ever before been invented. One size machine for any size dairy. The drudgery of dairying now, a thing of the past.

It separates the milk perfectly faster than ten men can milk it.

Start the separator when the milking begins and it being both automatic and continuous in its operation, when the farmer is through milking he is through skimming.

Speed of bowl brought up in 15 seconds and will run for hours without the slightest variation.

It is destined to revolutionize the dairy business.

We are at least FIVE YEARS ahead of all competitors.

rest of the development occurs on the pasture occupied by the host. Therefore, studies were conducted both on the pasture, and the animals in the affected locality, and under conditions as nearly as possible like those in open fields, in laboratory investigations, tests, and experiments. These are described in detail, the results given, and conclusions stated.

As all information which would assist in removing the greatest barrier to live stock raising in the South should prove of value to the future development and prosperity of the country now below the quarantine line, so also, is it of interest to the dealers and consumers of beef and beef-products in all parts of the country.

LIVE STOCK.

The bringing to California of 26 head of registered Holsteins which cost their owners in excess of $400 per head, is an event which should aid the dairy interests of the state. The McAllister ranch south and east of Pomona, or more properly Chino, in San Bernardino County, has just brought in this fine stock of some of the best strains of this dairy breed. This ranch is the property of J. W. McAllister and his son J. W. McAllister, Junior. The intention of the McAllisters is to give to California one of the finest cattle ranches in the United States.

There is in the ranch about 3000 acres of land, 1000 of which is rich valley land capable of being put into alfalfa and 2000 acres lying on the hills which make splendid pasturage. At present the ranch is stocked with grade animals, but gradually these will be weeded out and nothing but pure-bred Holsteins retained. Mr. McAllister informs us that ultimately there will be 300 or possibly 400 registered Holsteins milking on this ranch. At present there are only 150 acres of alfalfa, but this will be increased in time. One of the best dairy barns in the state has already been constructed of concrete and corrugated iron at a cost of $7000, and one large silo, with three others in contemplation.

Amongst the stock brought in are: Aggie Cornucopia Pauline, a champion four-year old with a record of 34 pounds of butter weekly; three daughters of Homestead Girl's Sarcastic Lad, one of the greatest sires of this breed; a granddaughter of Hengerbeld de Kol and Aggie Cornucopia Pauline, and we must not forget that this animal was first prize winner at the Illinois state fair.

An opportunity will be given to lovers of fine stock to see some of these animals at the coming state fair at Sacramento, but those who are situated so that they can visit the dairy near Chino will be more than welcome, for Mr. McAllister informs us he will be pleased to show dairymen over the place.

NATIONAL DAIRY SHOW.

The Sixth Annual National Dairy Show will be held in the International Livestock Amphitheater, Chicago, Illinois, Oct. 26-Nov. 4. $200,000 has been expended by the association during its last five shows for the promotion of the dairy industry. The sixth show will not only be the largest but the most attractive and comprehensive in the history of the exposition. The plans of the association are to make it intensely educational in every department of the dairy industry it represents, and to establish the annual exposition as the clearing house of the dairy industry in the United States, Mexico and Canada.

No cow can properly digest and assimilate balanced rations and economically convert them into milk unless she has been properly developed.

During hot, dry weather, when flies are troublesome, it pays to let the calves stay inside all day and let them run in the yards or pasture at night.

Prepotency does not come by chance, but through years of proper breeding for certain characteristics and a specific function.

Until we get perfect animals we should search for a sire that in some particulars is superior to the cows in our herds.

Veterinary

Answers in this column by Fred G. Matthews, M. S., D. V. M., 1232 Central Ave., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Cough.

A cow has a cough at night, and quite a discharge of clear and watery fluid from the nose. She eats and drinks and milks well. Kindly tell me what the trouble is.—Subscriber, San Gabriel.

Many healthy cows cough occasionally at night, after eating heartily. Inspect the feed, hay, bran, etc., to see if it is dusty or moldy. Has the cow sufficient ventilation in her stall, or is she exposed to drafts of cold night air? Should changing the food or attending to the comfort of the animal not improve the condition, you could have a veterinarian test the cow with tuberculin. However, the symptoms given are not sufficient to justify much alarm.—F. G. M.

"Wolf Teeth" and "Blind Teeth."

Recently my attention has been called to a small tooth which sometimes grows immediately in front of the first upper molars in horses, and these are referred to as "wolf teeth" and "blind teeth," which are supposed to finally cause blindness if not extracted. Is this the case?—Subscriber, Holtville.

Rudimentary supernumerary teeth are often found at the point mentioned, but they never cause blindness or otherwise injure a horse. However, because of a widespread though erroneous opinion that blindness does result, a prospective purchaser may refuse the animal because of their presence, and upon this pretext veterinarians justify the practice of extracting them.—F. G. M.

Pigs Diseased.

Hard lumps have apeared, one on the upper jaw between the eye and the nose of one sow, and on the lower jaw of another. I opened one and found nothing. Is this a contagious disease?—Subscriber, Covina.

Hard painless enlargements upon the jaws often result from diseased teeth. Examine the tooth adjacent to the lump, and remove it if decayed. I would not consider this a contagious ailment.—F. G. M.

Constipation.

Two sucking pigs, and fed barley while running on alfalfa pasture, showed constipation, lost their appetite, and died in a few days.—Subscriber, Covina.

A colt two days old died of constipation. What is the dose of castor oil?—Subscriber, Covina.

Rectal injections of soap solution or starch water is the most reliable method of relieving constipation in young pigs and colts. The injections should be repeated till all hard particles are removed. An ordinary fountain syringe serves the purpose admirably in these cases. Castor oil is given in doses of one pint to horses and cows, two to four ounces to sheep and swine, one to two ounces to cats and dogs, and one teaspoonful to fowls. The proper dose for your pigs would have been one to two ounces, and for the colt four ounces.—F. G. M.

Lines of breeding which a century has evolved and stamped with approval ought to prove safer than the theories of a single mind, made tangible in a few heterogeneous crosses.

Milk giving is a habit that responds to encouragement or neglect. It is a function which may be developed or diminished by the treatment accorded the cow.

We need to have a clear idea of what breeding does, of what feeding does, of what care and environment do, if we secure and maintain a profitable dairy heard.

Do your cows milk hard? Send 50 cents for teat expander. O. J. Weber Co., 225-227-229-231 East Sixth St., Los Angeles, Cal.

No Hoof-No Horse

Statistics show that 80 per cent of all horses are lame, and that 80 per cent of the lameness is caused by hard and contracted feet. Especially is the dry season in this section very hard on hoofs. As a hoof softener, toughener, nourisher and grower there is nothing equal to

Eshelman's Wool Fat Hoof Healer

A horse's hoof is from 60 to 70 per cent water. Grease and water will not mix. There is no grease about Wool Fat. It mixes readily with water, is very penetrating, and while a great medicine of itself, it also acts as a vehicle to carry to the afflicted parts the other medicinal properties of the HEALER. It gives natural stimulation and nourishment to the hoof. There is nothing that can compare with it for this purpose, nor as a remedy for tender, brittle, hard and contracted hoofs, split hoofs, quarter cracks, mud fever, scratches, corns, cracked heels, grease heels, and for all kinds of sores and cuts anywhere on any stock. It will surprise you with its power as a healer and restorer. It is not a new remedy, but has been on the market in the East for many years, where it has given the greatest satisfaction.

Bees and Their Care

BEE KEEPING IN PIONEER DAYS.

By Delos Wood, Santa Barbara.

Although my recollections of bee keeping extend back over 65 years yet they do not reach back to the first effort in advanced bee keeping.

The days of the straw hive in this country were in the remote past before my day. But I am told that it is still in use in some of the old countries. My father was called an advanced bee keeper when I began at an early age, to take lessons from him. He had discarded the straw hive and "log gum," and used box hives. Not the soap and cracker boxes that may yet be seen in some city yards; his were square, made of yellow poplar lumber one inch thick by 18 or 20 inches wide, with a wider board on top projecting two inches on all sides to turn the rain, the hive being about three feet high, resting on a bench eighteen inches or more above ground. About midway from top to bottom of the hive, cross pieces were nailed inside to support the combs. For surplus honey three-inch holes were bored through the top and a box holding anywhere from five to ten pounds placed on top. Ten pounds of this comb honey was regarded as an average yield. Sometimes the bees would fill two boxes and at other times they failed to enter these small boxes. But we must have honey and so the top was pried off and the combs cut out down to cross sticks, and what a delicious mess it was, old tough combs, bee bread, honey and brood in all stages! I enjoyed it.

Most bee keepers waited until the fall and then robbed the bees by burning brimstone under the hives and killing the bees. Then the hives were put in the cellar and the honey cut out as wanted for the table when company came.

I knew nothing of drone and worker comb in those days. But you can imagine what would be built in by the bees to fill the vacant space. About once in three or four years father would pronounce the combs too old. Then he would drive the bees into a new hive and cut the combs out of the old one and melt them up for wax.

Along in May or June, the bees would begin to cluster on the outside of the hive for air, as all the air inside came through two or three half-inch holes at the bottom. When the entire front was covered, we kept close watch for swarms, and oh what joy to me when the cry of "bees swarming" came from the watcher. Then bells, tin pans and horns were called into action, and the bees were driven back and forth from one tree to another until they grew desperate and clustered on a limb in spite of the racket. Then when they were shaken in front of a new hive tipped back slightly to give a larger entrance, the hunt began to see who would be first to see the king and coax him into the hive. All swarms had a king, and hundreds of queens.

The king was a large, long bee with a sting, but His Royal Highness was above using his and I could pick him up with impunity. The queens were large, bunty bees without stings. They laid the eggs. The king lived in a long peanut-shaped cell, and the bees adored him, but killed off the queens at the approach of cold weather and only kept one or two through the winter to start the colony in the spring. Nothing was known as to the length of life of the worker bees, but I have heard it said they learned to recognize their owners on their return home from a journey of over a year's absence. Those hives from which we had cut the combs were usually the first to swarm on account of the fact that they generally raised more queens.

In case of any severe sickness or death of any of the near neighbors or one of the family it was considered absolutely necessary to tell the bees of the fact or they would not swarm or produce honey. But my father always insisted that it was a superstitious notion.

The first improvement in hives that I remember was patented and consisted of two half hives hooked together side by side, and when filled with comb and honey and about ready to swarm the hooks were taken off and a hand saw run through, separating the combs and one-half of the hive was moved to another place and an empty hooked to each of the full ones, thus making our first artificial swarms. It was generally supposed that bees would not work without a king and so one-half would prove worthless. But the patentee came to the rescue by making a beeswax king, and hanging one in each half and the bees worked the same in each, as the beeswax king did no harm where the real king was, and I may add, no good in the other.

THE SELECTION OF A LOCATION FOR AN APIARY.

By E. D. Bullock, Redlands.

In studying the selection of a location for an apiary, I have considered the altitude and its flora, the water and prevailing winds, the market and its accessibility.

Relative to the altitude and flora, botanists tell us that the best honey plants thrive at an elevation of 1500 to 3000 feet. This elevation is so plentifully supplied with honey-bearing plants, that it is called the honey zone.

In this zone are found the alfilerilla, thriving from sea-level to a height of 3000 feet, and blooming from January to May; four species of manzanita ranging from 2000 feet to 9000 feet and blooming from February to November; here, also, are found the cottonwood and the willow. Black sage, queen of flowers, at the height of 1700 to 3000 feet, covers the unbroken hillsides with its wealth of bloom in April, May and June. The white sage grows in canyons and on plains, the elevation of which is between 1700 and 2500 feet, its period of blossoming extends into July, one month later than the black sage. Wild alfalfa, which produces light amber honey, is in blossom with the sages, unfortunately for the apiarist, at elevations of from 1200 to 2000 feet. These plants are followed by the wild buckwheat, which is found from 1200 to 5000 feet altitude and blossoms from July to December, and the blue curl which furnishes fall honey. In this zone only will we look for a location, and will locate at an altitude between 1800 and 2000 feet.

Convenient to the apiary should be a spring or running water. This is important. Bees watering at a pump spout or the watering trough of a near neighbor, cause trouble that ought never to be permitted.

A valley opening to the east is the first choice for an apiary. If practicable, place the hives at the highest point of the valley; lower down should be the honey house with its tank on the down grade. Then as the combs are taken from the hives, the honey goes down grade to the extractor, down to the tank, and down to the wagon which should be placed lower than the tank. In this arrangement of an apiary much heavy lifting is avoided. Once again the honey is moved down grade, this time, down the grade to market.

Nearness to market is desirable. But if you must choose between a poorer location near market, and a better location a few miles farther from market, take the more distant location. It is better to have something to haul a long distance than to have nothing to haul a short distance. Most of the above thoughts apply to a comparatively unsettled country. One point that needs to be emphasized is, that in a fairly well stocked district, one should buy out and only locate by buying out. Pay more for a site than it is worth, if necessary, but buy rather than crowd into a location. In a very few years the money will be more than returned. And in addition to the financial returns, the bee man will have a clear conscience. I do not know how it is with men in other vocations of life, but to the

General Agriculture

ALFALFA ON THE DESERT.

By A. N. Judd.

It is possible that some one just establishing a home on new land will appreciate a few words regarding one's experience in getting new ground ready for alfalfa. The first and all-absorbing question is securing feed for stock. Alfalfa is by all means the best; it is perfectly sure and is quickly ready for the stock of the new home maker.

If the soil is sandy and the wind blows hard enough to move it, a nurse crop is necessary to protect the young alfalfa; it is also of advantage in fall seeding to protect from the cold of winter. However, different times of seeding require different ways of planting this nurse crop. If planted in the fall, or say December, and it is desired to pasture it, sow directly in drills or broadcast. If the seed is tested and known to be first-class, ten pounds to the acre is sufficient. After the sowing, fine down the surface soil with a smooth drag and irrigate. The barley comes a little before the alfalfa and this tends to prevent the frost injury and the winter cutting of the young alfalfa plants. When it is safe from the frosts, say the middle of February or after, turn on the stock. They will prefer the barley for a long time while the young alfalfa is making roots, and that is essential to its future growth. If the pasture is divided so that the stock can be moved from one side of the field to the other, say on each piece a week, then changed, it is wise to irrigate the field not being used by the stock.

If you wish to sow to cut for hay, use Canadian peas as nurse crop. These may be sown in drills 20 inches apart, but drill the alfalfa seed in the usual way. The peas will mature in time to cut with the alfalfa for hay and by putting in small stacks so they will not mould they make the best of hay. Stock fed on such hay will work well without grain.

If you sow in the spring, use barley as a nurse crop, but sow the same as the peas in the fall.

Always have the ground leveled so as to take the water in perfect shape. When leveled, do not disk or plow but give light rolling lengthwise and sow across the borders. The firmer the ground the better the alfalfa seed will come. I may add that barley will tend to smother the alfalfa unless it is pastured; pasturing keeps it down and gives the alfalfa a chance.

In conclusion, I wish to urge every one to inoculate seed before planting. The Department of Agriculture will supply material and full directions. Your order should be sent in at least two months before it is to be used. By all means try this and be convinced.

THAT POSTAL DEFICIT.

The failure of the postal revenues to meet the postal expenditures is a subject of perennial discussion. The postal deficit, like the poor, we have always with us. Various plans and departures have been suggested to wipe it out. It has been suggested that the extravagant pay of the railways for carrying the mails be reduced. But with congressional bosses who would frank back and forth during the mail-weighing period tons of useless public documents for the mere purpose of stuffing the mails and increasing the railroad rake-off, this suggestion never got far.

It has also been recommended by at least one postmaster general that the government build and own the railway mail cars instead of paying the railroad more than their total cost annually for rent of the cars. But this recommendation never received consideration by Congress.

Recent disclosures of express company earnings add new and important arguments for a parcels post. It was Postmaster General Wanamaker who said that there were only four reasons why the people could not have a parcels post. These four reasons were the four big express companies.

The Wells Fargo Express company in the fiscal year 1909 earned net, after the payment of all expenses and taxes, over 86 per cent of the total value of all its property, and equipment used in its business, and received in addition $1,400,000 income from investments of the accumulated profits. It presented its shareholders with a special Christmas dividend of 300 per cent, or $24,000,000.

The American Express Company has been paying dividends of 6 to 12 per cent for years, on a capitalization half water; and last year received an income of $1,178,000 from investments of its additional, accumulated profits.

The Adams Express Company with a total investment of about $6,000,000, has, in recent years, in addition to high regular dividends, distributed additional, accumulated profits in special dividends, amounting to $36,000,000 and last year received from its accumulated profits not yet distributed an income of over $1,000,000. So that another special distribution dividend of 100 per cent is about due to the Adams shareholders.

The pertinence of these facts in connection with the postal deficit is this: These earnings represent what the public is paying private interests for the transportation of express—freight, parcels, and also mailable matter, and money, transported by the express companies partly in competition with the postal department and probably in contravention of the postal laws of the United States.

Now the public has little use for the independent express company arrangement. The public wants a parcels post conducted by the government for the transportation of smaller parcels and the railroads should furnish adequate fast freight service for the transportation of such large parcels and shipments as require exepdition. A parcels post, established on an honest basis, would give the public better service at lower rates, and yield a revenue that would wipe out the postal deficit. However, a parcels post is not recommended by the present postmaster general.

The present postmaster general calls attention to the postal deficit and recommends an increase of the postage rates on periodicals and magazines to meet the deficit. The present postmaster general is astute and able and he knows, or he ought to know, that the increase of postage rates on magazines, which he recommends, would not reduce the deficit but would increase it. He knows, or he ought to know, that if such an increase were made the express companies would make arrangements to transport and deliver large, bulky magazines and periodicals at a rate enough lower to get that business, and that they would get it away from the postoffice. He knows, or he ought to know, that this would result in the loss of a large revenue to the postoffice without a corresponding reduction in expenses, and that only the express companies and the railroads would benefit.—La Follettes.

An analysis of sheep manure indicates that it contains about 6.2 per cent of nitrogen, 7.3 per cent of phosphoric acid and 6.6 per cent of potash. It is higher in phosphoric acid than that derived from cattle. In other respects this analysis shows it to be not dissimilar in composition to ordinary yard manure. At prices prevailing for commercial fertilizers, say 18 cents for nitrogen, 4 to 5 cents for phosphoric acid and 5 cents for potash, it would be worth about $3.55 a ton. Of course, its value would depend on the care and skill with which it had been handled. It should be protected from leaching by covering and from fermentation by keeping moist. While the goat has made a good deal of progress in America in the past few years, it has not been as carefully studied as our other classes of live stock, and probably on this account it has been difficult to locate an analysis which would give the data desired.—Coleman's Rural.

The apricot crop of Durham, Butte County, will be about 200 tons.

"Beats 'Em All for Making Money"

"I have run..... and many other machines, but the Wolverine beats them all for making money. I have put 216 pounds of dry straw in a bale and 175 pounds of hay." (Abstract from letter received. Name and address of party furnished on request.)

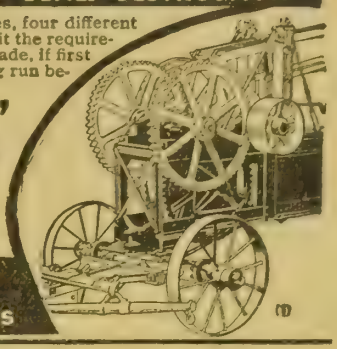
From "stem to stern" the Wolverine Hay Press is RIGHT. There isn't a dishonest or careless spot in its whole make-up. We have the biggest plant in the country devoted exclusively to making Hay Presses. The Wolverine has made an enviable reputation—and it is maintaining that reputation and increasing its facilities every year to take care of the growing demand.

A smooth, even, heavy bale comes from the Wolverine Hay Press. It is a fact that dealers will often pay more for hay put up in nice bales. It eats hay as fast as it can be handled by four men in a mow. It can be depended upon to work every hour in the day without a repair man constantly "tinkering" around. It is built for hard, long service.

Wolverine Hay Press

WOLVERINE CONSTRUCTION DEFIES DESTRUCTION

The Wolverine is built both with steel and wood frames, four different sizes, all with double gears, with various equipments to suit the requirements of purchasers. It isn't the cheapest Hay Press made, if first cost is considered, but it is the **cheapest baler** in the long run because there is an absence of repair bills.



Write FOR THE "Wolverine Book"

Every farmer will find many interesting and instructive things in the "Wolverine Book." A postal will bring this book to you. It's worth asking for.

INDEX; 774, 775.

Circular 63 of Agricultural Experiment Stations of California describes methods of making an observation hive for studying the habits of bees, especially desirable in schools.

THE INDEX.

Some of the best reading matter in this issue of the Cultivator is on pages 774 and 775. It is the best reading because it refers to a vast fund of information which has appeared in the columns of the Cultivator for the past six months. We like to refer to the page on which this is given because these two numbers, 774 and 775, indicate the number of pages given to subscribers for 50 cents for the six months. We can add one page more, because if the last page of this issue is noted, it will be seen that the pages of the volume total 776. This means 3,104 columns. To be honest we must confess that not all of this is reading matter, though we hope everyone of the columns is read, for sometimes the advertising is of greatest interest. But of the 3,104 columns, over one-half, or 1620, are reading matter.

As so much of this has been furnished by practical field workers and those not directly connected with the management of the paper, we may be justified in suggesting that for the most of California producers this is reading matter of a value which could be found in no other publication. We do not believe any other paper on the Pacific Coast has more original matter furnished by field workers and scientific people than has the Cultivator. We would not claim all the wisdom, but we feel enough pride in this matter to beg our readers, who may also be subscribers to other farm papers, to make comparison in quantity and quality. As to quantity of reading matter furnished, we are 404 columns ahead of our closest competitor.

This affords opportunity for a suggestion made at the time the index was published six months ago, and also a year ago. The suggestion is to file away the papers. Almost every question of interest to producers in California is presented here during each year, and this index enables one to turn almost instantly to the discussion of the point at issue. This file with the index preserved makes the California Cultivator almost a complete library in itself.

A MARVELOUS STORY.

In December, 1909, we gave a "Marvelous Story" which was taken from the advertising columns of the Buffalo Courier. It referred to the scheme of a company with a high-sounding name giving all kinds of guarantees as to results from lands which it urged people to purchase in Florida. As the promoters themselves admitted; "Never have you had such a wonderful offer as we are making. Not only will the lands make you independent for life, but the work of this company pledged to propagate, distribute and market Luther Burbank's wonderful products, will place you in a position to receive immense profits." The lands were sold on the installment plan and in such a way as to appeal to school teachers, clerks and others with limited incomes. In the same editorial we referred to these extravagant schemes and added that "That this will catch thousands of Eastern suckers goes without saying, and the pity of it is that they will be largely those who can ill afford to lose their money." Now comes out in the Rural New Yorker a statement from one of these suckers, but strange to say the correspondent who gives his story and his experience in buying land asserts that it was absolutely worthless and reached only by a day's travel with a team of mules. "The land was nothing but the poorest kind of sand. Mr. McNiel raised one basket of beans and sold it for $1.00; he spent $7400 for irrigating, labor, etc."

DRY FARMING CONGRESS.

Those in charge of the dry farming congress which is to be held in Colorado Springs October 16 to 20, assert that the most valuable and instructive display of dry farmed agricultural productions the world has ever seen will be made at that time. It is urged that all sections send dry farming exhibits for this exposition. California should manifest more interest than she did last year, when at the last congress she put herself in a class with South Africa and South America by sending only one representative, Prof. Shaw of the State University, being the one delegate from this state. Other states of semiarid America sent forty and fifty delegates, all showing most intense interest. California is primarily an irrigation state, but the proportion of land under irrigation is small compared with that on which dry farming methods must obtain for all time to come.

Some of the Rocky Mountain states are already starting movements to perfect county organizations which shall take up the matter of making exhibits. The Colorado state legislature has appropriated $10,000 to be used in the promotion of this congress.

An interesting line of experiments is being conducted by Messrs. W. H. Volck, Horticultural Commissioner of Santa Cruz County, and W. S. Ballard of the Department of Agriculture at Washington, in the effort to secure a remedy for the downy mildew. The experiments are being carried on in the orchards of Mr. Charles H. Rodgers at Watsonville. They consist of all imaginable kinds of sprays upon the trees in every possible method of application. Some material results are being secured in the spraying with aniline dyes. Sulphur, Bordeaux, and other forms of bluestone sprays, lime, soap, crude oil, distillate, are all being used. Just what the results will be no one can predict. Doubtless another year will begin to show results, and we will be informed by the investigators as to the commercial handling of this trouble in the orchards.

The National Lumber Manufacturers Association has issued a voluminous report of nearly 300 pages, giving in full the proceedings of the Ninth Annual Convention, and a statement of the purposes for which the association was formed. The Secretary is Mr. Geo. K. Smith of St. Louis, Missouri, and the book gives complete list of other officers. It contains much of importance to the lumber industry and affords valuable information to all interested in the conservation of American resources.

Prof. Wickson made a point in his address before the nurserymen's convention that perhaps the most criticised men are nursery people. Mistakes are often made by the grower in ordering plants not suited to the location in which they are to be planted; also in his placing labels after plants are set out; again in not giving proper attention at the time of planting with the result that many die. Nevertheless the whole failure is charged up to the nurseryman who sold the goods. We presume the nursery people themselves would not set up the claim of infallibility, but possibly all of the charges are not justly laid at their door. Prof. Wickson jollied his hearers with the suggestion that criticism was of the greatest value to them, in fact, is of value to all of us in compelling us to stop and take stock of ourselves occasionally and figure out the amount of justice in the criticism. When we do this we are reasonably sure to take a step forward unless we allow the criticism to put us in a grouchy frame of mind. Then its value is all lost and we are the losers because of our own grouch.

The California State Agricultural Society is sending premium lists for the 1911 Fair, or as it is officially termed, the Fifty-eighth Annual Exposition. The Fair is to be held on the grounds at Sacramento from Saturday, August 26th, to and including Saturday, September 2nd. The premium list is said to be the most liberal ever issued by the association. Promise is made for a new grandstand, new dairy exhibition building, dairy barns, and other features adding to comfort and accommodation of visitors and exhibitors. We are told that applications for entry blanks are greater than any previous year at this time. The new officers of the organization are: A. L. Scott, President; C. Allison Telfer, Secretary. The list will be sent to anyone who is interested enough to ask for it.

San Francisco County has never had a horticultural commissioner appointed. Indeed, it is not usually regarded as a horticultural county, but we believe such an impression has been the cause of much damage to other sections of the state, as thousands of plants are sent out from that county without inspection, carrying insect or fungus pests. The nurserymen have felt that they were relieved from official inspectors, but now realize that the freedom has meant loss to them, consequently an effort is being made to secure the appointment by the county board of supervisors of a commissioner.

In referring to varieties of spineless cactus, their thornlessness and the quantity and quality of leaf produced, Lurther Burbank in a recent address said that there were more varieties of thornless cactus than there are of peaches; some produce great quantities of fruit, others but little fruit and much forage. Selection of varieties should be made with an idea as to forage or fruit desired. He spoke of one plot of an eighth of an acre, set 2½ by 5 feet, which yielded 46,000 pounds the third year from cuttings.

A suggestion which we recently heard made by a nurseryman has a hint which should be of value to others of his calling. It was in effect that the nurserymen should secure the establishment of a nurserymen's experiment farm. It was not elaborated any more than here given, but we imagine that if the nurserymen would combine and present the matter to the Department of Agriculture or our State University that suggestion might lead to securing state or government aid along this line. The nurseryman's calling is a most important one and every effort should be made to make it as exact as possible.

The total number of irrigated farms in the state of Washington is 7,405, which more than doubles the figures of the census of 1900. The total acreage now under irrigation is 334,378, an increase of 140 per cent over the ten years preceding.

Agricultural News Notes of the Pacific Coast

Northern California

Hop growers near Wheatland, Yuba County, report they expect a big yield.

An apple cider and vinegar factory is in prospect for Sebastopol, Sonoma County.

The sportsmen of Alameda County have declared war on the blue jay and butcher bird.

Twenty cars of fruit have been shipped from Vacaville, Solano County, this season.

Farmers of Clear Creek near Oroville, Butte County, will have a heavy crop of red oat hay.

Several carloads of mules were purchased in Durham, Butte County, for shipment to Honolulu.

Twenty-three counties of the state have acted favorably on the fair tax for the 1915 Exposition.

A wheat grower at Florin, Sacramento County, has found specimens of the Hessian fly in the wheat.

Citizens of Diamond Springs, Eldorado County, have organized a company and will build a creamery.

A farmer at Yankee Hill, Butte County, has just installed nearly 2000 blue-blooded Angoras on his ranch.

Trustees of Reclamation District 1001 held a meeting at Yuba City last week and discussed levee construction.

Eight additional patrolmen have been placed in the Plumas National Forest to minimize risk from forest fires.

Gridley peach growers have contracted some Tuscan Clings at $42.50 and Lovells at $30 for canning purposes.

An assessment that will total $200,000 is to be levied to build levees in reclamation district 684, San Joaquin County.

Property owners near Freeport, Sacramento County, are planning to organize a reclamation district and build levees.

Trustees of reclamation district No. 777 held a meeting at Like Oak, Sutter County, and decided to deepen the ditch to the tules.

Extensive carload shipments of cedar logs are being made from Beckwith, Plumas County, to be used in the manufacture of pencils.

A big standardization meeting was held in Fair Oaks, Sacramento County, last week. The growers seem unanimous in endorsement of the movement.

A demonstration was recently made in Fair Oaks, Sacramento County, of the use of dynamite as an aid to farming in breaking up hardpan to secure drainage.

Levees costing half a million dollars are to be constructed along the Sacramento River between the Feather and Bear Rivers. 33,000 acres will be reclaimed.

Strawberry growers at Orland, Glenn County, are doing well with strawberries this year and anticipate that increased planting will bring big profits next year.

The Davis Almond Growers Association held its first meeting last week and members expressed themselves thoroughly well pleased with the work of the state association last year.

Central California

Some Dinuba raisin growers have contracted their Sultanas at 5c.

Canneries do not expect to start on peaches until the middle of next month.

Apricot growers near Reedley, Fresno County, have received $60 to $65 a ton for their apricots.

The prune crop of the Santa Clara Valley, it is anticipated will be from 50 per cent to 60 per cent of normal.

The plant of the Corcoran Sugar Company has been sold to Los Angeles capitalists at a stated price of $750,000.

Greenfield, Monterey County, has just finished stacking its second crop of alfalfa and is busy irrigating for the third crop.

Turlock Cannery began on apricots June 20th and expects to have them well out of the way for peaches the middle of next month.

Packers are offering $90 a ton for Kings County raisins. Growers are not selling very rapidly, a number holding out for $100 a ton.

The first dried apricots of the season were shipped out from the Oleander district this week. The amount was something over a ton.

Plans are being made for the Prune Carnival to boost that Santa Clara County product at the Third National Industrial and Food Exposition.

The Kerman alfalfa mill was delayed in starting by the unusually cool season, but the heavy second crop now cutting will keep it more than busy.

San Jose Grange at its recent meeting heard an interesting exposition of the cause of sour sap in fruit trees by County Horticultural Commissioner Morris.

Dinuba, Tulare County, claims the largest eucalyptus for its age in the world. It is twenty years old and measures fourteen feet ten inches in circumference.

It is stated that though the number of peaches will be less this year than usual, size will be much better and tonnage will total much better than it has been supposed.

The Terra Bella section of Tulare is rapidly coming into prominence as a producer of citrus fruit and claims that before many years it will be a rival of Lindsay and Porterville.

Tulare County papers estimate that that county's output of oranges will be larger this year by 600 cars than in the past. The trees are loaded and the June drop was remarkably small.

The Santa Clara County Poultry Association elected H. Berar and E. R. Ever delegates to the State Federation of Poultry Associations which will convene in Santa Cruz next month.

Wheat harvesting is on in earnest in the Terra Bella neighborhood of Tulare County. Many of the big ranches have been cut up for fruit culture, but the income from wheat and grain is still a big factor in that district's prosperity.

Orange growers and others of Porterville have signed petitions asking the board of supervisors to refrain from joining the San Joaquin Valley exhibit at the Panama-Pacific Exposition. The county feels strong enough to make a great exhibit of its own.

Southern California

The new sugar factory at Anaheim will begin slicing the 15th of next month.

The Colorado River has passed its highest stage for the present flood season, about 26 feet.

School children of Orange County are valuable aids in the apricot orchards and dry yards.

Imperial Valley cantaloupe growers are netting about 75c a crate for unpicked melons in the field.

A prune famine for Southern California for the next four months is predicted by fruit distributors.

Saticoy bean ranchers are delighted with the cool foggy weather which has been favorable to crop growth.

Four thousand head of cattle from Arizona are being distributed through the Imperial Valley to be fattened on alfalfa.

Farmers of Julian, San Diego County, are planning to run an auto-truck daily to deliver their produce to the San Diego market.

The Pomona canners and dryers are finding a scarcity of apricots this season. As high as $45 per ton has been reported paid.

The Pomona Cannery opened for business June 26th. Extensive improvements and additions have been made to the plant.

The new sugar factory at Huntington Beach, Orange County, is ready for operation. It will take care of over 10,000 acres of beets.

The property of the Huntington Beach Canning Company has been sold and will be transformed into a rolled barley mill and bean cleaner.

San Bernardino County last year harvested 450,000 pounds of honey besides producing 5000 pounds of wax, the whole valued at nearly $30,000.

Brawley, Imperial County, is to receive some effective advertising in moving pictures of its Melon Fiesta and cantaloupe industry from field to train.

Some Crafton, San Bernardino County, citrus growers have experimented with an auto-truck for hauling oranges from groves to packing houses.

Directors of the Escondido Valley Poultry Association will hold their poultry show the first week in December, instead of in conjunction with the September Fair as formerly.

The directors of the Lima Bean Growers Association urge farmers not to sell their beans until after their annual meeting when they can be in touch with every feature of conditions for the year.

San Bernardino County's bee inspector is calling for a county ordinance compelling property owners to keep their land free from milkweed as the fluid exuded by the weed holds the feet of the bees and they starve to death.

The board of supervisors of San Bernardino County has found that apiarists of Utah are running their bees into that county to catch the early flow of honey, later taking their hives away. This has caused the enacting of a new ordinance prohibiting importation of bees into that county without inspection.

The Coast

Wheat and barley raisers of Almira, Washington, estimate a 700,000 bushel crop.

Idaho ranchers are experimenting extensively with rape and millet for forage crops.

Farmers of Yuma Valley are planning to get together for a big Fourth of July celebration.

The Pacific Logging Congress met in Vancouver, B. C., June 22nd, for a three days convention.

Orchardists at Keisling, Washington, are using powder in cultivation of hardpan orchards.

The Grange at Everett, Washington, objects to reciprocity and is out flat-footed for free trade.

The great Rattlesnake district tributary to Prosser, Washington, has over 19,000 acres in wheat.

A sheep man at Pullman, Washington, finds wool production twice as profitable as pork production.

Sheep shearing is on in the Boise section of Idaho. The clip runs a good average in quality and quantity.

Japanese gardeners have purchased 5000 acres of rich land near Galveston, Texas. Rice will be the staple.

The strawberry season of Prosser, Washington, which is just coming to a close, has been exceptionally good.

Miles City and its immediate surroundings claims the shearing of more than a half million sheep within one week.

A Yuma hog raiser last week shipped out 110 head of young Duro-Jersey sows which netted their owner $1320.00.

The first cotton of the season in Texas was baled in Cameron County last week. The first bale of 493 pounds brought a price of $1015.

Three hundred and thirty threshing outfits have been supplied by Walla Walla manufacturers to the harvest fields of the Northwest this year.

Pendleton's second wool sale resulted in no offerings of wool being made. The only sale reported recently was for a small clip at 12½ cents.

Many fruit growing sections of Idaho have sent in petitions to the state horticultural commissioner for the appointment of district inspectors.

The sugar factory nearing completion at Fallon, Nevada, on the Trukee-Carson irrigation project, has 2000 acres of beets already contracted for.

Hay cutting and curing begins this week in the Walla Walla Valley, Washington. Owing to the long period of cool rainy weather the hay crop is exceptionally good.

A new creamery company formed at Kennewick, Washington, will encourage the dairy industry by importing 200 or more pure bred dairy cows which will be distributed amongst dairymen.

Apple crop prospects in the Pacific Northwest are estimated by the Northwest Fruit Exchange as follows: Hood river, 50 to 60 per cent of 1910; Rogue river, 40 to 50 per cent of 1910; Milton-Freewater, 35 to 50 per cent; Wenatchee, same as 1910; Yakima, 30 to 50 per cent of 1910; southwestern Idaho, heavier than 1910; Virginia, 60 to 65 per cent.

DARLING'S
HIGH PROTEIN
BEEF SCRAPS
Makes chicks quickly mature into lusty broilers, and laying hens when fed daily. It has been used for years by successful poultrymen.
Ask your Dealer for Darling's and take no substitute
GERMAIN SEED & PLANT CO. Los Angeles

THE ONLY

Bolster Spring

that is high grade. Made like a carriage spring. Changes any farm wagon instantly into a spring wagon. Saves the wagon. Easier on the driver. Makes one wagon answer for two. Absolutely necessary where oranges, cantaloupes, fruit, etc., are hauled. Any capacity, 1000 to 12000 pounds. Prices the lowest. Illustrated Price List on request. Write today. Beware of imitations.

ARNOTT & CO. 112-118 South Los Angeles St. LOS ANGELES, CAL.

BUY LAYING HENS NOW

PRICES ARE LOWER RIGHT NOW THAN AT ANY OTHER time of the year. If you need hens take our advice and buy them right now. We can supply fine young White Leg'.orn yearling hens at $8.50 and $9 per dozen. No matter how many you wish, we can supply them at this price right now. These prices are good this month only. In July and August hens are worth more. in September these same hens will be selling at $12 and $15 per dozen. Buy them now and make a big saving. Send today for catalog of prices on baby chicks of all kinds, hens and pullets, etc.

THE **PIONEER HATCHERY** CO.
112 East 8th Street, Los Angeles

F. BALDWIN'S WHITE LEGHORNS

Winners from Seattle down. Bred as layers first. Stock, any age for sale. Eggs $6 and $10, per 100. Settings $2 up. Send for New Free folder and prices.

1st. Ckl A. Y. P. Ex 46 Wash. Ave. San Jose, Cal.

WINSLOW'S REDS
Annual Reduction Sale of Stock and Eggs.

Monrovia, Cal.

Let Us Brood Your Chicks

To those who have difficulty in starting baby chicks for vigorous growth, we can furnish now or in the near future, vigorous chicks *five* weeks old as follows—

Blk. Minorcas 25c per strong chick
R. I. Reds commercial stock 25c each
White Leghorns 20c each

Younger chicks for local delivery

Gardena Hatchery, Gardena, Cal.

Profit in the Poultry Yard

Practical poultry people who may have ideas from their experience as to methods of feeding and housing and general care of poultry will convey a favor upon the Cultivator and its circle of readers by sending in concise accounts. Mrs. Basley is always willing to answer queries which with the experience of others should make this a most valuable feature in poultry life on the Coast. Opinions or matters of a personal nature should be omitted, but a concise statement of facts is always valuable.

TREATMENT OF DIARRHOEA IN FOWLS.

B. F. Kaupp, Pathologist, Colorado Agricultural College.

The Veterinary Section of the Colorado Agricultural Experiment Station has been experimenting with different remedial agents with the view of finding some drug that would, at least, curtail the enormous loss among barnyard fowls from the various forms of diarrhoea.

Space will permit the discussion of only one agent. The one that has thus far given us the best results is the Sulpho-carbonate compound, prepared by the Abott Alkaloidal Co., of Chicago.

One flock consisted of sixty birds. Several were sick at the time treatment commenced and four had died. The discharge from the bowels was of a greenish-yellow color, somewhat simulating fowl cholera. One thirty-grain tablet was dissolved in a quart of water and this fluid mixed with bran and corn chop. The mixture was then fed in clean troughs. In this way each bird got approximately one-half grain. This was repeated night and morning. No additional birds became sick, only two of those sick died, and the rest recovered.

Another flock consisted of 175 baby chicks. As soon as these birds were taken from the incubator, they were fed the unhatched eggs that had been cooked and chopped. This mixture was reported to possess an offensive odor. The birds began dying with symptoms of diarrhoea, white pasty vent, weak, dull, droopy wings, etc. One-half the flock died before treatment was begun. One-half tablet was dissolved in warm water and the bread saturated with it. The birds immediately quit dying.

Still another flock consisted of 200 birds, including a few turkeys. Cholera had appeared on the premises the fall before. The outbreak was studied in the field and laboratory. The germ (B. Avicepticus) was isolated. In the last outbreak 14 birds had died and several were sick. Similar treatment was used as in the above flocks, except that powder was used instead of the compressed tablets. One tablespoon, rounding full, was dissolved in each two gallons of water. This water was kept constantly before them. No more birds were taken sick and no more died after the sixth day.

The above is a good illustration of three types of diarrhoea in which we have found this drug by far the best agent tried.

The poultry people will probably be able to secure this drug through their local veterinarian or druggist. We have not investigated the commercial side of it.

WHY HENS CACKLE.

My theory follows: The jungle fowl of India, from which all our domestic hens are descended, lives where many predatory animals and reptiles also find their homes. The female jungle fowl for this reason seeks a secluded and safe place in which to deposit her eggs. When she is ready to produce an egg she retires to her nest and broods there for some time. In the meantime her mates have wandered away from the place where she left them. Probably several hens are absent from the flock attending to their maternal duties at the same time. When the egg is deposited the hen quietly goes to a distance from her nest and then begins to cackle in order to announce to her chief that the necessity for concealment no longer exists. The cock at once begins to cackle and the hen knows where to find the flock. Once she gets sight of the flock she ceases to cackle at once. This theory accords with facts.

I have six varieties of hens in close confinement and watch them pretty closely. I have hens that have never cackled so far as I know, and others that cackle once or twice when they come off the nest. I have one breed the hens of which rarely cackle at all after laying an egg.

I have some Pheasant Bantams, which in color and size are almost exact reproductions of the original jungle fowl. The hens cackle after laying an egg just as long as it takes them to find their mate. Very frequently the others of the little flock are close by when a hen comes from the nest and she does not cackle at all. The crow of this little cock is exactly the same as that of the jungle fowls I have seen, short and high-pitched, and he has the jungle bravery. He tackles anything, little or big, that seems about to injure one of his hens.

Domestic fowls have quite a long vocabulary, as plain and as understandable as the language we use in communicating intelligence from one to another. The poultryman who pays proper attention to his birds understands this language as well as he does his mother tongue. He can tell by its language when a little chick is lost, when it is ill, when it is eating or when it is getting ready to go to sleep. He needs to make no investigation to tell when a hawk flies over, when a hen is scared, happy or hungry. He understands what his fowls are saying even when he can only hear their voices. From the time "the clarion cock proclaims the morn" until the fowls fall asleep at night he understands their language and every sound they make is as intelligible to him as if they used the purest English. Miller Purvis, in Breeders' Gazette.

THE HARDINESS OF TURKEYS.

One subscriber disputes my statement that there is no difference in the hardiness and domestic qualities of turkeys, citing the Bourbon Reds as being particularly domestic, hardy and prolific. Such statements are not borne out by a careful consideration of facts. The Bourbon Red is only a few generations from a cross of Bronze and White turkeys, and there is no reason why it should be tamer, hardier or more prolific than either of its parents. I have a neighbor who has Bourbon Reds, and I do not see that they are better in any way than the White or Bronze turkeys of other neighbors, and I have an opportunity often to see all of them. In fact, one neighbor has a flock of Bronze turkeys that are as tame as Bantam chickens, which is the limit among fowls. Another correspondent takes the trouble to send me a government bulletin to prove that I was wrong in saying a turkey with a crest would not be considered pure-bred. This does not change the fact in any way. The bulletin mentions that ocasionally a turkey will have a small crest, but does not say such a bird would be considered fit to enter a show, which is the criterion by which we determine the breeding of fowls. Every one knows that there is a breed of turkeys in southern Mexico and the isthmian states of Central America which carries a crest, or rather an aigrette on its head. This is known as the oscellated turkey, but it has never been domesticated. A turkey with a crest is a freak which should not be used for breeding purposes, if pure-bred fowls are sought, as the crest would debar such a specimen from exhibition anywhere in this country, except as a freak.—Miller Purvis in Breeders' Gazette.

The balanced ration is highly desirable and will insure nomal development and rapid growth. For laying hens the ration should contain more protein than for fowls fattened for market. Laying hens also require more mineral matter, such as crushed egg shells, bone meal, etc., to form shells.

FERTILITY OF EGGS.

We are frequently asked how the fertility or non-fertility of an egg can be determined before incubation. It can't be done and keep the egg whole. If the egg shell is broken and the germinal spot on the yolk is examined, an experienced observer can say whether it is fertile or not. With the shell whole, and the egg known to be from a flock with which males are running, there is no test that will determine whether it is fertile or not until the egg has been incubated for a few days.

The fertility of eggs depends chiefly on the condition of the breeding stock, the number of females alloted to one male, the conditions under which they are kept and the food. If the breeders are in poor condition you will get many eggs that do not hatch well or that produce puny or weakling chicks.

Eggs may be fertile and yet not hatch well. This is because the germs are weak or poorly nourished, because of poorly balanced egg food content. This may be due to debility on the part of the breeders or to poor feeding. Similar trouble results from breeding from birds forced for egg production or from a male that has too many mates and is taxed beyond his capacity. Where such conditions exist chicks will die at all stages of incubation and some for several days after exclusion. The germ may also be injured by overheating the eggs or keeping in too warm a place while saving for hatching. Less frequently trouble may result from chilling the eggs. Strongly fertile eggs from good, healthy stock will often hatch well and produce good chicks under apparently unfavorable conditions. Obviously the remedy for unproductive eggs is to use only healthy breeding stock and to keep the breeders in good condition by good food and good common sense, care and management.—Am. Poultry Journal.

SELECTING EGGS FOR HATCHING.

In selecting eggs for hatching, great care should be exercised. There is great difference in eggs and although it is not generally known, it is possible to arrive at some idea of their possibility of hatching before they are put into the incubator or put below the hen. An egg which is to produce a strong chicken, should have a shell which indicates an even texture. If, by holding it up to a strong light, the shell appears to be porous or patchy, or there is a ridge or thickness encircling the eggs at some point, or a roughness on both or either ends, discard such eggs, and do not try to hatch them, for you will be disappointed. In a fresn egg the air cell is always small. As the egg becomes older, the air cell increases in size. A few practical tests will teach you the difference, so that you can quickly make the proper selection.—No. Dakota Farmer.

Always keep your poultry house light and dry. Lice and sunlight do not agree at all, and where there is a great deal of sunlight there are liable to be very few lice. Provide plenty of dust baths for your birds. If a hen can wallow in dust, she will usually keep reasonably free of lice. Add a good insect powder or the home-made powder to the dirt in the dust boxes. Carbolate of lime is also good to use in the dust baths, and it is also a good plan to powder this around the floor and walls. If the lice and mites get a foothold among your young chicks, they will make a clean sweep there.

Vegetables should form a good portion of the diet for poultry the year round is the opinion of Commercial Poultry. They promote health, increase the egg yield and are an economical feed. Celery tops, cabbage leaves and such other refuse vegetables as are available in the winter help. A good ration for laying hens is composed of wheat, buckwheat, oats and corn, the wheat predominating.

Milk is as good a feed for hens as for pigs, and will bring as much profit.

The surest way of having the best is to breed from the best.

Eggs can't be had without hens, but some can take most any hen and induce her to lay.—Coleman's Rural.

DON'TS FOR INCUBATORS.

1. Don't shake your incubator or the incubating eggs, as it ruptures the embryos and causes the chickens to die in the shell.
2. Don't have dirty, oily lamps or short wicks that smell up the incubator room.
3. Don't put the thermometer where the first chick that comes out of the shell will knock it down.
4. Don't worry about the hatch on the last day. Just see that the temperature is O. K. and forget it.
5. Don't use the incubator for a wash bench.
6. Don't set the machine in the hen house where vermin will get into it.
7. Don't lend your machine. Let the other fellow invest in one also; it will do him good.
8. Don't forget that the brooder must be ready for the chicks, so don't wait until the last moment before getting it cleaned and warmed up.

When you take the eggs out of the machine to air, it does not mean to cool them; although they do cool in the airing. When the eggs are airing, the incubator door should be closed in order to keep the egg chamber warm. It often takes an hour for eggs to reheat after being aired.—Poultry Standard.

Charcoal is a great absorbent and should be used freely in the drinking water. A little pulverized charcoal fed occasionally will greatly assist in maintaining the health of the fowls. The best plan is to have it handy and when feed is being mixed, put a spoonful in the mush. This should be done once or twice a week.

If you confine broody hens, do not neglect to give them feed and water. Too often they are forgotten and allowed to suffer. If they must be confined, put them near the feeding pens, where you will be reminded whenever you go to feed the others.

Success depends almost wholly upon management, no matter what breed you have.

You poultrymen put your hens on the right foundation when you use Lee's Lice Killer. There are other lice killers, but only one LEE'S—remember that. One of the best endorsements of

LEE'S LICE KILLER

is the fact that dozens have tried to imitate it—and *you know no one would attempt to imitate an inferior article.* Lee's Lice Killer kills by vapor and contact. It is quick and sure fatality to lice, and just as certain to keep the hens healthy. It is the ONE safe, sure and economical way to stop lice damage. Always ready, easy to use. 35c, 60c, $1.

GERMOZONE

Has Been Saving **CHICKS** For 14 Years

It was the result of Mr. Lee losing one-half his chicks in 1896. He was driven to do something and do it quickly. He spent more than a hundred dollars to get it for his own use. The idea of putting it on the market came from his neighbors' volunteer purchases. As a remedy for Bowel Complaint in chicks it stands alone as a result producer, is not injurious, removes both the disease and cause, leaving no bad after effects.

Germozone is a germicide—bowel regulator—system builder. Endorsed by poultry-raisers from coast to coast. Price, 50 cents. Buy it from your dealer in either liquid or tablet form. Or direct from us postpaid, if your dealer cannot supply.

Everything for poultrymen that is worth buying and using. Write for descriptive printed matter, and a free copy of Lee's "Chicken Talk" by Geo. H. Lee, himself.

Come in and see our new 1911 line of Mandy Lee Incubators and Brooders at our newly opened Los Angeles branch, 225 West 2d St.

THE BLIND CAN SEE

Interior View of Our Office 443 East Third Street

That it pays to purchase Supplies from us.

THE DEAF cannot help but acknowledge the force of our argument in favor of buying direct from wholesaler and manufacturer.

THE DUMB sing our praises after purchasing our goods.

Metaphorically speaking, these things have actually come to pass. We have more than made good our claim to sell you your Groceries and General Merchandise Supplies at Wholesale Prices. If you will consult our Price List on page 743 of last week's Cultivator, you will see that we are selling at Less than Wholesale Prices.

Don't Stand in Your Own Light

By being disposed to trade at home, when you can make a saving of 25 to 40 per cent by buying from us. You know that a hundred prosperous farmers are worth more to your community than one prosperous merchant. You know that the dollars you save in buying from us does you more good than if they went into the pocket of your local dealer. You know that your local dealer does not buy at home if he can purchase cheaper in Chicago or New York. You know that you can buy from us as cheaply as the retail dealer can, and save the retail dealer's profit for yourself.

If you are not already a customer, become one now. Don't put it off, but send us an order, small or large, that we may demonstrate the truth of our assertions. We Sell Satisfaction, and if you do not get it, you get your money back with all transportation charges.

Ours is not an idle boast, but actual facts. We have been in business in Los Angeles 10 years, and have lived here 26 years, and can refer you to any bank, business house, or civic organization in this city as to our reliability. See last week's Cultivator, page 743, for Prices, also

POULTRY

The Standard Poultry Yards. Back again with my first love. I have just received from the best White Leghorn breeders in the East 200 selected heavy-weight Knapp and Wyckoff trap nested White Leghorns, not one scoring less than 91 and up to 96 points. I am now prepared to furnish baby chicks and eggs together with my Cook and Kellerstrass White Orpingtons. I feel sure I have the best on the Coast. C. A. Loud, Prop., 3944 Cleveland Ave., San Diego, Cal

Having Purchased the stock and business of the Standard Poultry Yards, we are prepared to furnish on short notice either the Cook or Kellerstrass Crystal White Orpington Eggs for hatching from the finest birds in the land. Give us a call and be convinced. Prices furnished on application. Standard Poultry Yards, E. C. Worden and Son, props., 4004 University Blvd., San Diego, Cal.

All We Know is Rhode Island Red Chickens. But we know them so well that our baby chix, $15 a 100, are the best on earth. There! Pure blood, good strains, well mated by expert breeders. I. X. L. Poultry Yards, 587 Mission St., Santa Cruz, Cal.

How to Make Money—Mrs. A. Basley's New Poultry Book is just out. It is without exception the most wonderfully complete manual on the subject of successful poultry management ever written. The secret of how to raise every turkey hatched and the "Basley Formulas," now published for the first time, are worth many times the price of the book. The "Western Poultry Book" is a practical book by a practical woman. Price $1.00. Address Mrs. A. Basley, Box 77, Venice, Cal.

The Goodacre Strains—Just the time to get our Quality Reds, our special offer on eggs from choice matings of $3.00 per 15 or $5.00 per 30 is hard to equal; our commercial day-old chicks we now offer in 100 lots at $12.00; our Reds have been constant winners the past three years in our Coast shows. We can sell you choice eggs, Buff Orpingtons, Anconas and White Runner Ducks. Write us today. Goodacre Bros., Compton, Cal.

BONNELL'S S. C. BLACK MINORCAS WIN EVERY TIME.
At Los Angeles Show, 1911, every first premium and two silver cups; two specials for best male and female. Eggs at half price, $2.50 per setting. C. C. Bonnell, 2919 Brighton Ave., Los Angeles, Cal.

Baby Chicks from my pure-bred stock S. C. White Leghorns, carefully selected for laying and standard qualities. $9.00 per 100, $85.00 per 1000. Eggs for hatching $5.00 per 100. Correspondence solicited. J. R. Heinrich Poultry Yards, Arroyo Grande, Cal.

R. I. Reds—Much time may be saved in producing heavy layers by buying eggs from a breeder who has established a record by specializing in heavy laying stock. Eggs, hundred $5.00, finely pointed; 15, $3.00. "The Luedkes," Anaheim, Route 1.

Rose Comb R. I. Reds—Eggs one-half price balance of season. A few breeders for sale. Young stock later. Mating list on request. W. H. Pickering, 984 E. 55th St., Los Angeles, Cal.

Poultry Wanted—We pay the highest market price for all the local poultry we can get, no matter how large the quantity; also fresh ranch eggs. We remit immediately. Allaway & Layton Co., 607 E. Third St., Los Angeles, Cal.

White Leghorns—Buff Orpingtons. Bred for beauty and great egg production. Grand lot of both old and young stock for sale. Prices reasonable. Write your wants. Model Poultry Farm, Box H, Irvington, Cal.

Rhode Island Reds—Eggs for hatching from high grade stock. Also some very choice cockerels, cheap considering quality. Write for prices. Frank Greenleaf, Greenleaf St., Santa Ana, Cal.

Orland Hatchery—White Leghorn chix, $8.50 per 100. $80.00 per 1,000. Brown Leghorn chix, $8.50 per 100. P. L. Simpson, Orland, Cal.

Hicks Jubilee Hatchery, now booking orders. Write us your wants. We use eggs from first-class stock only. Try us. W. J. Hicks, Petaluma, Cal.

White Orpington and White Wyandotte eggs for hatching. Send for list of winnings. Arthur W. Huskins, 713 Waterloo St., Los Angeles, Cal.

Barred Plymouth Rocks—The kind that "Win and Lay." Eggs and stock for sale. C. H. Vodden, Los Gatos, Cal.

Rose Comb Black Minorcas, nine years line bred. Stock and eggs in season. Eleanore Minorca Farm, R. D. 1, Los Angeles, Cal.

RARE PLANTS

Wild Plant Improvement Gardens, Santa Ana, California. Newton B. Pierce, proprietor. Rare choice ornamentals and new fruits from all lands.

Tropical and Semi-Tropical Fruits and Ornamentals. Headquarters in California. Montarioso Nursery, Santa Barbara, Cal. Descriptive, illustrated price list free.

Ferns for growing on Adiantum pedatum 5c, Pteris serrulata 3c, Aspidium tsusimense 3½c and 5c. Terms cash. Ballou's Nursery, Pasadena, Cal.

FOR RENT

Imperial Valley Fruit Ranch to Let—160 acres in early table grapes, apricots, alfalfa and cotton; 2 miles from county seat. Tenant must have experience, and $3000 capital to furnish labor. Address Horticultural Dept., Box 2, El Centro, Cal.

HORTICULTURAL PRINTING

Catalogues for the seed and nursery trade, the live stock and poultry industries, are a specialty with us. Two thousand illustrations to select from. Write for prices and samples. The Kruckeberg Press, 237 Franklin St., Los Angeles

MACHINERY

For sale—Second-hand windmills, g engines, wagons, buggies, harness. gang, walking, riding and side hill slip, Fresno and wheel scrapers; 2 he 2 balers, seed sowers, spike tooth and harrow, mowers, rake, fanning mill, washer, disc cultivator, reaper, blower, vil, eveners; road grader, road roller, two-horse sprayer, mining hoist, sundr ds

WINDMILL OUTFITS.
8-ft. steel star mill, $19.50; 10-ft. banks, 30-ft. 4 post tower, 60 ft. galv. pipe, rods and brass cylinde se f. o. b.; 12-ft. steel star, 4 post tower, ty rods and cylinder, $60 f. o. b.; 13-ft. motor, pumping and power mill, cost ar $120, for $60; 12-ft. Aermotor, tower, 10,000-gal. tank, tank-stand, 100 ft. 3-inch pipe in well, rods and cylinder, $150 fo this large irrigation outfit.

ENGINES.
4 H.P. Stearns in fine shape, 6 H.P. Fairbanks, 6 H.P. White & Middleton, 6 H.P. Union complete with No. 3 vertical centrifugal pump, $175 f. o. b.; 25 H.P. engine and hoist.

TANKS, TANKS, TANKS.
50 gallons to 50,000; 3000-gallon tanks at $29. Why buy new when we save you half and guarantee material? Demmitt Company, 120 N. Main St., Los Angeles, Cal.

For Sale—Complete pumping plants, new and second-hand. Electric and gas engine driven. All sizes. Send us your details for our recommendations, irrigating appliances and pipe molds. We can save you money on your installations. H. U. Roeding & Co., Foxcroft Bldg., San Francisco, Cal.

New Smith & Thomas hot air engine and deep well pump for sale at ½ price; also new International Gas engines at greatly reduced prices. Consolidated Vehicle Co., 13th and Mission Sts., San Francisco.

For Sale—Pomona deep well pump, 35-inch capacity. Used only 30 days. In first-class shape. Will sell cheap. Chris Robson, Highland, Cal.

For Sale—16 H.P. Foos gas engine, also 9 H.P. Both overhauled and guaranteed. Bailie & Brandt Co., 943-945 N. Main St., Los Angeles, Cal.

For Sale—Small gas engine with pump jack attached, separate if preferred. Bailie & Brandt Co., 943-945 N. Main St., Los Angeles, Cal.

For Sale—One 32 H.P. Fairbanks-Morse distillate engine, like new. Machinery Exchange, Main and Bruno Sts., Los Angeles, Cal.

For Sale—A complete tree spraying outfit cheap. Jordan Oil Co., Joy and Santa Fe track, Los Angeles.

SEEDS

Ahuacate (Alligator Pears, Avocados), Persea Gratissima. New crop is now coming from Mexico. None better for stock. $4.50 per 100; $40 per 1000. Montarioso Nursery, Box 1500, Santa Barbara, Cal.

NURSERY STOCK

For Sale—First class Eureka Lemon trees. Inquire D. N. Findlay, 218 Orange St., Redlands, Cal.

FARM LANDS WANTED.

Farms Wanted—We have direct buyers. Don't pay commissions. Write describing property, naming lowest price. We help buyers locate desirable property Free. American Investment Association, 12 Palace Bldg., Minneapolis, Minn.

AUTOMATIC POULTRY FEEDER.

Many poultry feeders have been placed upon the market, of more or less value. A new one to the Pacific Coast is now offered by the Bayley & Lyon Company of San Francisco. This appliance was first brought out a year and a half ago at Norwich, Conn. Before it was offered to the trade, however, a number of the machines were placed in experiment stations, and reports made by the staffs of these stations were so favorable that they are now being placed in all markets. They are well made, will last a lifetime, and, with it all, the price is low. Poultry readers should write Bayley & Lyon, who represent the Norwich Automatic Feeder Company on the Coast. It is said that 50 per cent of the labor of feeding is saved by the use of this device, and an actual saving of 25 per cent in the feed cost is another factor. The egg production has also been increased 18 per cent. The manufacturers say they have placed 20,000 of these feeders with Eastern poultry people.

GROWING.

A social event which those who participated in hope will be repeated every year, took place at the Mt. Washington Hotel, Los Angeles, last week when the business management and employes of the California Drug and Chemical Company gathered to celebrate the change of name of that concern and the great increase in its business. Of course there were heavily laden tables and enthusiastic speech making by the heads of various departments. This is the concern which has presented its announcement for several years to readers of the Cultivator under the name of the Braun Chemical Company. The addition of a general wholesale drug business and the confusion with other firms of the Coast is the cause of this change.

The Byron Jackson Iron Works of San Francisco has just completed a notable order for the Chicago-Rogue River Company, for pumps to be used in their plant for raising water to the ditches of the Josephine Irrigation and Power Co. of Oregon. The contract called for one ten-inch horizontal belt driven, 4-stage centrifugal pump to deliver 3500 gallons of water per minute under a head of 365 feet, and one 10-inch horizontal series 2-step belted centrifugal pump to deliver the same quantity of water under a head of 210 feet. The order was placed on May 1st, and shipment was made just two weeks later. The designing of pumps for duty of this kind calls for the highest type of engineering skill, and the layman who sees and admires the machinery in action little dreams of the problems that have to be solved in cases of this kind before the drawings are sent to the workshop. The Byron Jackson Iron Works make a specialty of work of this kind, and their engineering force is fully capable of handling any kind of problem connected with the pumping of water.

Questions and Answers

THE EDITOR AND STAFF

Questions to be answered in this department should be received at this office a week before reply is expected. Write only on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Lizards in Apiary.

In reply to Hemet, page 674, you can catch the lizards by placing a few of the flat spring-over mouse traps in the runs of the lizards. What a pity we cannot train the lizards to eat the ants and leave the bees alone! Why not try raising the hives on blocks? Procure some 2x4 scantling, and cut your block 5 inches long. Make a slope 4 inches long by 1 inch deep. Three of these blocks will level up a hive, one at back and one at each side, raising your floor board away from the lizards.—Joseph Gray, Wasco.

Ridding Apiary of Lizards.

Place a box, barrel or small tub that will hold water in convenient place in apiary or between hives in such a way that hives are about level with top of tub. Take a piece of thin board, a shake, side of orange box or the like. two inches wide and long enough to reach across the tub. Shave off one side, tapering from near the middle to each end, leaving only about three-quarters of an inch at each end. Then hollow out the opposite side in the middle for a few inches. Sharpen a piece of the board three or four inches long, and insert in the center of the hollowed out side in such manner as to evenly balance the board on the tub. As the lizard crosses this tipping board he is dropped into the water below. I have seen seven mice caught in a dishpan of water in one night by this method. A large bucket will do for lizards. Bait with cheese for rats and mice.—Subscriber, Ceres.

Irrigating Asparagus.

Last fall we transplanted our old asparagus bed, putting it on land that without irrigation would be high and dry before now. It has six or eight stalks to the plant and green berries on now. So far I have kept the ground moist. How much longer should it be irrigated? Would potash be any help to keep oats from lodging on summer fallowed land where there is no humus? How much should be used per acre?—Subscriber, Lakeside.

If you wish good results from the asparagus, continue to irrigate it until fall, just as you would any other crop that you wished to make a fine growth. If you keep it growing until the end of the season you should be able to use some of it next spring, but do not cut for too long a time. After next year you should have a full crop. Fertilize with stable manure if you can get it. —Q. A. L.

Plowing Out Old Alfalfa.

I have alfalfa badly run out, now planted with barley which is ready to cut. The alfalfa remaining would probably not make a third of a crop. Is it a good plan to reseed on old stand? Soil is sandy loam. If plowed out, how long would it take to get ready for alfalfa again? Would it be well to rent to Japs for truck farming in order to get rid of the alfalfa?—Subscriber, Highland Park.

We would not under most circumstances rent to the Japs for gardening, for the land is worth too much to permit of the exhaustion which would probably result. The method of handling and reseeding as given by Mr. Neff is as follows:

"When alfalfa is in the condition stated it will be much the best to plow the field instead of reseeding. In order to make a success the land should be plowed twice, using a sharp, thin plowshare. The first plowing should be as shallow as can be done to cut all the roots, then in about three weeks plow again as deeply as the plow will turn a furrow. It will be better to use a sixteen-inch plow than one narrower. It will be best to plant a crop of corn after the plowing, and follow with one or two crops of potatoes before sowing the land to alfalfa again, though alfalfa can be sown after the second crop of corn if the cornstalks are plowed under deeply so as to be out of the way of the mower."—J. B. N.

Gas-Tight Tents.

I have fumigating tents leaking badly. What can be done to fix them? Is crude oil satisfactory?—Subscriber, Fullerton.

If the cloth is old and rotten, the sooner it is discarded the better. If comparatively new and coarse-meshed, it may be helped for a short time by saturating with a solution of tannin. This tends to close the pores somewhat. A still better method perhaps is the use of the cactus solution. This is the leaves of the ordinary desert cactus thrown into water until the mucilage-like substance fills the water. This gives a coating which lasts for some time, but the best method of all is the original purchase of the cloth which is used generally. The ordinary duck of the tent maker proves rather too porous to be satisfactory. The cost of material is too great to use these tents after they have lost their gas holding capacity.

Red Ants.

How can I rid my place of red ants? They persist in coming into the house, cupboard and every place where they are not wanted.—Subscriber, Kingsburg.

One of the best remedies is a slight sprinkling with buhach, which is a California product, and if secured fresh will drive away ants or almost any insect infesting the place. We have seen shelves on which was some sweet the ants were after, surrounded with a very light sprinkling of the buhach, and within an hour every ant would have left, and the same place not be infested again for weeks. There are other remedies, some of which have been advertised in the Cultivator. We may refer to Kellogg's Ant Paste, which a great many claim is especially good. Another way is to follow out the trail until the regular home of the ants is found, and then carbon bisulphide poured down the hole and a wet sack laid over will usually destroy the whole bunch.

Damping Off.

I send you a young plant from my orange seed bed. After they have two, or at most but very few leaves, they die off by the thousand.—Subscriber, Porterville.

This is simply the attack of fungus usually spoken of as "damping off." It is caused by too much moisture at the surface of the ground. Some have overcome it in part at least by the liberal use of charcoal on the surface of the soil. The use of good sharp sand in surfacing up the seed beds is also a help. Again, one should be very careful and sprinkle the plants in the morning, so the sun will dry off the surface soon after the sprinkling. Sprinkling at night in warm season encourages the growth of fungus, and before morning thousands of plants will die.

Potash in Oats.

Would potash keep oats from lodging on summer fallowed land where there is no humus? How much should be used per acre?—Subscriber, Lakeside.

I think an application of 200 pounds of potash per acre would be a benefit. Sow it evenly over the land when you sow the oats and harrow it in.—Q. A. L.

Flavor of Oranges.

In the Cultivator of some weeks ago we answered the question as to the flavor of Arizona oranges and said: "Climate and soil conditions are no doubt responsible for the grade of fruit produced in Arizona." Dr. R. R. Snowden, of Los Angeles, now writes that if a representative sample of soil from Arizona orchards is sent to him prepaid, he will analyze and try to discover the difference between that and the soil of some orchards where oranges are not so good. We have written Dr. Snowden that we did not think soil analysis will definitely answer the question of quality of fruit. We think this matter of quality is one of balance in the forces of nature, and determination of any one factor will have little to do with quality.

Pears Dropping.

I send you small pears which turn yellow and drop always before they arrive at the size of a small cherry. What is the cause and remedy." I sprayed with the 4-4-50 Bordeaux to which was added Paris Green. Could it be that the Bordeaux was the cause of the failure?—Subscriber, Lakeside.

This was referred to Dr. J. E. Coit at the Whittier Pathological Station, and he writes:

"After examining the specimens with Professor Smith, we came to the conclusion that the pears are turning black and falling off on account of a lack of proper pollination. In making a cross section of those which were green on one side and black on the other, we find it invariably the case that on the black and shrunken side the seed have failed to develop. This denotes partial pollination. Where the entire fruit was black, we found no seed developing due to entire lack of pollination.

"Spraying will not help matters. The remedy is to plant near the non-bearing trees varieties which bloom at the same time and bear an abundance of pollen. If this is not practicable, you might put into the tops of the non-bearing trees a few grafts from desirable pollen-bearing varieties."

Weevil.

What is the best method of preventing weevils from getting into grain?—Subscriber.

The best method is fumigation with carbon bisulphide. One pound of the bisulphide will probably be sufficient for 100 bushels of grain. Place in tight bin where the gas cannot escape and leave over night, setting the bisulphide in shallow dishes on top of the grain. The gas is very heavy and will settle through all the grain and destroy everything that breathes. Of course, if the building in which the grain is stored is badly infested, other treatment may be necessary for perfect protection.

Drying Peas.

What is the process of drying garden peas for table use?—E. L.

The only method we know of is either the regular patented process of evaporation or curing fresh vegetables which has been advertised in the Cultivator and is doubtless the best, or as some have done, allowing the peas to become almost ripe, then drying in the sun. The first process mentioned gives the product which when prepared for the table is practically equal to the fresh peas from the garden, but appliances to conduct this process would be too expensive to install for home use only.

Germs Detected in Milk.

Can the germs from a tuberculous cow be detected in her milk, and will those germs endanger the health of human beings?—M. E. F., Goshen.

Health officers assert that these germs can be detected in the milk from tuberculous cows, but we venture that the claim that it can always be done would be disputed. There are various stages in this dread disease, and there might be times when the worst infected cow might fail to give off any germs in her milk. However, we do not wish to speak too positively in this matter because it is ground on which there has been much discussion and difference of opinion. It is safest to assume that there is danger of infection and discard all milk from animals known to be diseased.

Chronic Bronchitis.

A valuable cockerel after a hot spell became affected with a bronchial hacking cough. Careful examination revealed no obstruction. Olive oil, turpentine, kerosene and roup cures do not seem to cure. Never has lost bright comb and is vigorous. Can you help us? Do foamy soft brown droppings indicate worms in the bowels? Do reddish flesh colored droppings indicate the same? Will turpentine cure most safely and surely?—Subscriber.

Try a teaspoonful of honey with five drops of eucalyptus oil in it three times a day. Keep it up regularly for a week. This will usually cure. Honey is one of the most useful medicines in bronchial affections. Another good soothing tonic is a fresh raw egg put into a bottle and the same amount of olive oil added. Shake vigorously so as to mix it thoroughly and give a teaspoonful three times a day. Soft brown droppings usually indicate too much animal food or bad animal food, or indigestion. Add charcoal to the mash and carefully examine the animal food, as if bad it may result in ptomaine poisoning. The reddish color in the droppings is a leading symptom of worms. I have found turpentine and castor oil the best and safest remedy. Thoroughly clean and disinfect your yards. My chickens became affected with worms from the droppings of neighboring pigeons, and I have known of other fowls getting them from wild birds. Plant a green crop as soon as possible, and give the fowls as much green food as you can supply. At this season of the year fowls need more green food than most persons give them.—A. B.

Faulty Incubation.

What is the cause of chicks hatching and not absorbing the yolk, also the entrails around drawn in? This machine has made fine hatches throughout the season. Duck eggs in the same machine hatched 92 per cent. I applied no water, as the machine was standing in water part of the time and the moisture indicator indicated correctly. Chickens are covered with a sticky substance and do not dry fluffy.—Subscriber.

Evidently the heat was too great during the last week. This would make the hatch too early and the yolk would not be properly absorbed. The white would also be too much dried and would be sticky. These results come from overheating and are more likely to occur in warm summer weather than at any other season. I would advise you to run the machine about half a degree lower in the summer than in the spring for the whole hatch.—A. B.

Early Moult.

My hens were a year old last February and have been laying since early last fall. They are now moulting. Is this as it should be or not? I am a novice in the chicken business.—J. S., Kenwood.

If the inquirer had mentioned the breed it would be easier to give the reason of the early moult. If hens did not moult last year in their pullet year they are likely to moult early this summer, at least this is the rule. Also if your hens have been sitting and hatching chickens they usually moult early, and if you handle them right they will make good fall and winter layers from having an early and natural moult. If all our inquirers would bear in mind to mention the name of the breed that they have it would be easier to answer the questions. Each breed requires different handling and different food.—A. B.

Chicken-pox.

Some of my 7-weeks old chicks are dying fast. They have something like a wart come on their nostrils and eyes and some under the beak. Some I greased with sulphur and lard under the wings and on the head and for one day they seemed better, but the following day they died off fast. The skin under their wings looked cooked and has a bad smell. There is no pus in the warts and when I loosen the scab it bleeds, dark, thick blood. Can it be a form of chicken-pox?

Your chickens have chicken-pox. The cure is to put a little carbolic salve on each "wart" or spot, and give the chickens a little sulphur in their mash, about a teaspoonful for a dozen chicks per day for a week; feed soft food like bread and milk, and put a little Epsom salts into the drinking

(Continued on Page 771.)

San Francisco-Los Angeles Produce Markets

Los Angeles Market

LOS ANGELES, June 28, 1911.

Butter.

Prices on butter remain unchanged. Receipts are light, some days even below 50,000 pounds.

Prices to trade 2½c in advance of the following Produce Exchange quotations:

Extras	22½
Firsts	21½
Ladles	18
Country	15
Eastern	21

Cheese.

Local Anchor	16
Oregon Daisy	16@16½
Northern Fresh	14½
Domestic Swiss	18
Imported Swiss	30@32

Eggs and Poultry.

Eggs have recovered some of last week's lost ground and a two-cent advance is noted with a very firm condition prevailing at present.

Beeswax, lb	24@30

Hay.

Scott, Magner & Miller say:

The amount of hay that we have received on the San Francisco market during the week ending today amounted to 2850 tons. A large proportion of this came in by the boats from barns and warehouses located on the water, and consisted entirely of old crop hay. There have been comparatively light arrivals by the railroads.

The reports from the various hay districts apparently show a much larger yield than even the most sanguine expected a few weeks ago, and even where the crop shows apparently short from former yields it is thought that the weight will probably make up somewhat to swell the tonnage of the total crop. There appears to be no effort made on purchase account in any direction, as it is still very early and the market as yet entirely undetermined.

The alfalfa situation is very quiet, and very little of this article is being brought into San Francisco. The crop reports on alfalfa are encouraging, and the yield and quality shown to be good. We do not see any outside outlet for alfalfa hay such as we had last season, which helped the general market materially.

We quote the wholesale prices in round lots on today's market as follows, viz:

Fancy wheat hay	13.50@14.50
No. 1 wheat or wheat & oat	11.00@12.00
No. 2 wheat or wheat & oat	10.00@11.00
Choice tame oat	10.00@12.50
Other tame oat	8.50@10.50
Wild oat	9.00@10.00
Stock hay	6.00@8.00
Alfalfa	9.00@10.50
Straw, bale	40@50

Grain.

Wheat	1.42@1.50
Barley, fancy	1.28¾@1.30
Barley, good to choice	1.25@1.27½
Oats, white	1.50@1.60
Rye	1.50@1.60
Mustard, brown	5½
Alfalfa seed	5½
Millet	3@3½
Flaxseed	5@5½
Broom corn seed, ton	25.00

Feed Stuff.

Alfalfa meal	14.00
Bran, ton	27.50@29.00
Feed cornmeal, ton	33.00@34.00
Cracked corn	33.00@34.00
Rolled barley, ton	26.00@27.50
Rolled oats, ton	29.00@30.00
Middlings	32.50@35.00
Oil cake meal	42.00@43.50
Cocoanut cake, ton	25.50@26.50
Mixed feed, ton	25.00@27.00
Shorts	29.00@30.00

Deciduous Fruit Market

Sacramento, June 24, 1911.

Manager McKevitt of the California Fruit Distributors reports:

The following gives number of cars of deciduous fruit shipped from all points in California for the week (7 days) ending Friday morning, June 23, 1911:

Cherries.

Forty-six cars. This week's report shows a gain of practically three cars over last week. The crop is now past its zenith and shipments may be expected to decline from this time on. The Santa Clara valley is the only section shipping at the present time.

Apricots.

Seventy-eight and one-quarter cars. The apricot movement shows a heavy gain this week. Fruit is coming from several different sections and is being widely distributed. Up to the present there have not been enough cars of this fruit to go around. No difficulty will be experienced in future, however, in supplying the demand. Movement will continue for the next week for about the same volume if the demand justifies, after which time a material falling off will undoubtedly be noted. Fruit is of good quality, free from defects and is giving splendid satisfaction.

Peaches.

Forty-seven and three-quarters cars. Peach movement now consists very largely of the Triumph, of which variety straight cars are now available for quotation. Fruit is of fair size and good quality. Hales and St. Johns will follow. A few of them will probably make their appearance the latter part of next week. Crop of early varieties of peaches is very good.

Plums.

Thirty-nine cars. Shipments of Clyman plums are now nearly concluded. Tragedy, Burbank and Climax are becoming more plentiful but are still scarce, owing to poor ripening conditions.

Pears.

A few early pears have already gone forward. More will be shipped this coming week. Bartletts are not expected to make their appearance until about the first of July, and there can be no considerable shipments of this variety until probably about the 10th of that month. Crop is looking fine.

Grapes.

Nothing new to report in this variety. Vines are growing vigorously, showing an unusual wealth of foliage, and great vigor. Bunches are numerous, well set and of large size. Promise is for a splendid crop of first class quality.

Weather.

Since our last report we have been having considerable cool weather, which has again retarded ripening. The months of May and June, up to date, have been the coldest on record in California for many years.

Citrus Fruit Market

LOS ANGELES, June 28, 1911.

The auction markets show a material advance over last week's quotations on Valencias and this in general is an indication of the tone of the market. There are some sections, however, of the Middle West which still show a little of the former weakness, but with the shipments kept within bounds there is little question that Valencias will clean up at most satisfactory figures.

Lemons are still in the dumps, caused by the two factors of heavy foreign receipts and cooler weather obtaining in most of the Eastern sections. It now looks as if there would be no more of the exceptional prices which prevailed two or three weeks ago. This does not mean that any disastrously low prices will prevail, for present indications are that the demand will be sufficient to keep the market fairly clear.

Shipments.

Shipments of oranges to date since November 1st, 1910: 32,341 cars, lemons 5,011, total 37,352. To same date last season: Oranges 22,245 cars, lemons 3,325, total 25,570.

LOS ANGELES, June 21.—Four cars Valencias and one car lemons sold.

"Were you ever in a railroad disaster?"

"Yes—I once kissed the wrong girl while going through a tunnel."—Toledo Blade.

The enterprising firm of Layne & Bowler Co., Santa Fe Ave., Los Angeles, whose advertisement appears in this issue of the Cultivator, has just issued a very valuable catalogue giving much information in regard to the pumps they manufacture. Besides describing the pumps, it contains chapters on: "How to measure your water supply," "How to make a weir," "Water measures," "Power to drive pumps," "Useful information and formulae for calculating pump problems," etc. This catalogue will be mailed free to any one desiring it, if you mention that you saw their advertisement in this paper.

PACIFIC COAST NURSERYMEN.

(Continued from Page 755.)

states and territories, and it is only natural to infer that the horticultural progress will follow along the lines of the least resistance. It is a well known fact that the impounding of water from our great streams, fed by the inexhaustible supply of unfailing snows and glacial deposits of our vast mountain ranges, is largely responsible for the progress of horticulture in the Pacific Coast states. Who is the convincing factor in creating a change in the topography of the country and in finding its hidden resources, if it is not the nurseryman? Who pioneers the way for bettering the conditions of every rural community and frontier town, if it is not the nurseryman? What has brought about the remarkable changes in the great wheat fields, causing land which was only worth a few dollars per acre a decade ago, to rise in value to hundreds and even in many cases to thousands, if it was not the nurseryman, who through his experience gained in other sections where similar conditions existed, was in the position to make recommendations as to what to plant, to bring about these remarkable values? Who is it, if it is not the nurseryman, who is constantly by his association with other nurserymen, not only at home but abroad, trying to elevate our rural conditions, by introducing better varieties of fruits, a wider range of them, and also to make the homes of the farmer and fruit grower and the residences of the towns and cities, more attractive, by introducing ornamental trees, shrubs and plants, which would never be thought of, were it not for his investigations, which make him a competent judge of what to recommend to brighten and make all of us more appreciative of the beauties of nature?

"No power on earth will prevent a true nurseryman from continuing in this course; our field is a vast one and the difficulties we will have to contend with will increase as our horticultural development enlarges. I firmly believe that "In unity there is strength," but I am also impressed with another factor, and that is, each state will have its own problems confronting it and on account of the vast territory to be covered, the states should have their individual associations, which will affiliate with this association."

QUERIES.

(Continued from Page 769.)

water for a week. (A teaspoonful to each quart of water.) Permanganate of potash or Germozone (made of permanganate) in the drinking water is also very good. Chicken-pox is very infectious. It does not usually kill the old hens but is fatal often to the young chicks. Do not use much of the carbolic salve and do not grease with it or any grease under the wings of little chicks as it always makes them sick and often kills.—A. B.

LOCATION OF APIARY.

(Continued from Page 762.)

apiarist a clear conscience is an ever present consolation.

In concluding, I would like to say that the government is expending large sums of money in reforesting the mountains, $15,000 is soon to be spent in improving the fire guards of the San Bernardino range, with the view of a large reforesting policy.

A person much interested in this work suggests that the bee men unite in a concerted movement to influence the government to reforest the lower elevations with honey-bearing plants like the manzanita, buckthorn, sages and buckwheat. He also suggests that if such movement were made by the bee men it might result in reforesting the lower slopes with honey-bearing plants as the government is learning by experience that the pines planted below 5000 feet do not thrive.

If crude oil, which is being used so much for street work, should happen to get on a dress, it can be cleaned by using pure alcohol. This removes all traces of the oil and does not leave a stain. I have used it on a tan rajah and a white serge skirt.

Beeswax and salt will make rusty flat-irons as clean and smooth as glass. Tie a lump of wax in a rag, and keep it for that purpose. When the irons are hot, rub them first with the wax rag, then scour with a paper or cloth sprinkled with salt.

A wise old owl sat on an oak,
The more he heard the less he spoke.
The less he spoke the more he heard;
Let's imitate that wise old bird.—Ex.

Manhattan Food

During the dry season, chickens need a substitute for the "little things" they pick up during the wet season—insects, worms, bugs, green stuff, etc., etc. **Manhattan Egg Food** supplies the need. It costs 13¾ cents a week to feed 100 fowls sufficient to keep them in perfect condition. The fowls will repay this small outlay tenfold with increased egg production. Contains no drugs.

ALL DEALERS, or write us direct.

The Norwich Automatic Exerciser and Feeder
A Wonderful Poultry Feeding Device

The U. S. Government Experiment Stations report 50% saving in labor, 25% saving of grain, and an increased egg yield of 18%.

NOW READ THIS:

Use for 30 days. At the expiration of that time, if you do not see a marked improvement in your flock, if your egg production is not increased, and if you are not absolutely satisfied with the machine in every respect, or find one objectionable feature, return it at our expense and we will at once refund your money. Write for descriptive circular.

HOW DO YOU BATTLE?

Did you tackle that trouble that came your way
With a resolute heart and cheerful;
Or hide your face from the light of day
With a craven soul and fearful?
Oh, a trouble's a ton, or a trouble's an ounce,
Or a trouble is what you make it;
And it isn't the fact that you're hurt that counts,
But only—how did you take it?

You are beaten to earth? Well, well, what's that?
Come up with a smiling face.
It's nothing against you to fall down flat,
But to lie there—that's disgrace.
The harder you're thrown, why, the higher you bounce;
Be proud of your blackened eye;
It isn't the fact that you're licked that counts;
It's how did you fight—and why?

And though you be done to the death, what then?
If you battled the best you could,
If you played your part in the world of men,
Why the Critic will call it good.
Death comes with a crawl, or comes with a pounce,
And whether he's slow, or spry,
It isn't the fact that you're dead that counts,
But only—how did you die?
—Edmund Vance Cooke.

TEA.

So far, civilized man has succeeded in manufacturing only four essentially different beverages which are extensively used. And yet liquids are as important as solids in contributing to the cravings of the human palate. The four principal manufactured beverages now in use by civilized communities are, first, the extract of the coffee bean; second, the extract of the cocoa bean; third, alcoholic drinks, and fourth, the extract of the tea plant.

Tea is one of the most important manufactured beverages known to mankind, inasmuch as it can be taken for a lifetime without injury to the human system, providing it is made right, and taken as soon as made. The Encyclopedia Britannica says: "What is indisputable about tea drinking is, that it forms an agreeable means of imparting the proportion of water necessary to human nutrition, which, being taken hot, communicates to the system a beneficial warming glow."

Its properties have been described by one of the earliest Chinese writers, Lo Yu, who says: "Tea tempers the spirit, awakens thought, prevents drowsiness, lightens and refreshes the body, and clears the perceptive faculty. The gentle exhilaration which accompanies the moderate use of tea is not followed by the depression which succeeds the use of alcoholic stimuli. Experience has proven that tea sustains the mind under severe muscular or mental exercise, without causing subsequent exhaustion."

The intelligent use of tea is in knowing that it possesses two leading chemical principles, viz.: theine and tannin. The former contains the principal merits, and the latter the principal imperfections of tea. Theine is a gentle tonic which makes tea a mild stimulant. Tannin forms an acid which, if taken habitually to excess, by persons in delicate health, is apt to affect the nerves or digestion. The whole secret, therefore, of obtaining the beneficial properties of tea without injurious effects, is to secure without tannin, and this can be accomplished by never permitting tea leaves to boil, nor even to draw in the usual way, for over seven or eight minutes, after which time tannin begins to develop.

The average consumer approaches his grocer generally with the request for a pound of black or green tea, knowing little more than this about the article, and leaving the rest with the grocer. It is not suspected by either dealer or consumer that there are as wide differences in black teas, alone, as there are between tea and any other beverage.

There are about two thousand tea flavors. Until the last seven years the green tea leaves have been found chiefly in China, but since then excellent specimens have been produced in India and Ceylon.

Green teas are known as Gunpowders, Imperials, Young Hysons, and Hysons, according to the shape which the leaves take in the process of firing.

Black teas are divided into four great families. Congons, Indias, Ceylons, and Oolongs, the first three kinds being fermented teas, while Oolongs are unfermented. — Phebe S. Copps, Colorado Agricultural College.

IN COOKYDOM.

Being fond of cookies, especially of wafers, but not fond of the usual lengthy process of cutting them out, I have abridged this process in the following manner:

Mix the dough smoothly, and divide it into pieces of the size of your fist, or a little smaller if the cookies are to be very thin; flour the board and pin thoroughly, and roll out one of these lumps into a convenient oblong. Move it to another part of the board, and sprinkle it lightly with sugar. Now roll out the next piece in similar shape, lay it on the first, sprinkle with sugar, and repeat until your dough is all used. Trim off the edges evenly, roll out the trimmings, and lay this sheet on the rest; then, with a sharp case knife, cut into squares, oblongs or diamonds. Taking the piles (six or eight deep) one at a time in your left hand, separate the cookies and slip them on to the baking sheet; this can be done more rapidly than they could be moved, singly, from the board. By following this plan, I can roll and cut a large batch of wafers in fifteen minutes; the baking is, of course, a slower process.

It is easier to handle a soft dough when it is very cold, and for this reason I find it a good plan to mix cookies overnight and have them thoroughly chilled. I append two receipts for delicate, brittle cookies. I have never tasted the ideal home-made, soft molasses cooky; but grated orange peel and desiccated cocoanut help to vary the everyday product.

Sugar Wafers.

One cupful of brown sugar, one-half cupful each of butter (or drippings) and water, one teaspoonful of mixed spices, one-half teaspoonful of soda, a little salt, and flour for a soft dough. Roll very thin, and bake in a hot oven.

Gingersnaps.

Half a cupful of butter or drippings (bacon fat may be used), one cupful of Porto Rico molasses, one teaspoonful of soda, dissolved, two tablespoonfuls of vinegar, two tablespoonfuls of ginger, a little salt, flour for a moderately stiff dough. Knead, roll thin, and bake as above—Country Gentleman.

HOMELY HINTS.

To clean brass gas fixtures, rub them with cut lemons, and then wash the juice off with hot water.

If soot falls on carpet, cover it thickly with dry salt, then sweep it up quickly, and it will leave no stain.

The most satisfactory method of sprinkling clothes is to use a good whisk broom kept expressly for that purpose.

There are those who ever listen for, and these ever hear, a voice silent to others; it is heard in the passing crowd, above the noise of the world's traffic, in the silence of the midnight, in the quiet of the dawn. To these it is not what the world can give, but what it cannot take away, that seems precious. To them nothing but the best is really worth while.—Ex.

Be noble! and the nobleness that lies
In other men, sleeping, but never dead,
Will rise in majesty to meet thine own.
—Lowell.

TO FRESHEN SUMMER DRESSES.

A nice organdie or thin muslin often becomes wrinkled and flimsy, but not soiled, and it can be made to look almost like new by dampening on the wrong side with thin gum arabic water and then pressing carefully.

The best way to clean very sheer muslins and lawns when they need washing is to clean them with bran water without using soap or starch as the bran water cleans the fabric and stiffens it at the same time. This water is prepared by boiling wheat bran, about two quarts to a dress, in soft water for half an hour; then this water is strained into a tub half full of cold water and used instead of soap suds. The garment must be cleaned by pressing and squeezing between the hands, then rinsed through one clear water and hung over the line; then it must be ironed on the wrong side before it is quite dry.

Brown linen waists and dresses can be kept fresh and new looking by washing them through starch water into which a cup of strained coffee is stirred and the starch must be stirred until it is evenly colored before washing the garment.

Muslin of a doubtful color may be washed in rice water, without soap, rinsing out in rice water to keep the starched quality, and a little dissolved gum arabic should be added to the rinsing water, as it gives a newer finish to the goods, and the fabric will retain the stiffness longer.

To wash the pretty ginghams and percales successfully, shave enough white soap in warm, soft water to make a nice lather, then stir in enough borax to make the suds soft to the touch, then the garment must be cleaned by rubbing lightly between the hands, never on the washboard. The borax not only softens the water but helps to keep the color in the goods and if the color has not been set before washing the garments, it should be rinsed in cold water, slightly salted, to which a little vinegar has been added, then it should be hung in the shade to dry. To keep white dresses a beautiful clear white, wash them through hot suds in which a little borax is dissolved, then add a tablespoonful of borax to the water in the boiler and the borax is especially good to use if the garment has turned yellow or is not a good color of white.

In making starch for colored fabrics, dissolve a piece of alum the size of a hickory nut in warm water and add to every pint of starch used and it will keep the colors bright for a long time.—M. A. T.

LOVE IN THE HOME.

Discussing the matter of a loving home and answering the question as to "How may love continue," a writer in Farmer and Fireside says:

By expression. We like to do something for one we love; if we fail to do it, our love languishes. It grows by service. How the mother loves the crippled child for whom she does so much; how the wife loves with unspeakable tenderness the husband whose failing health is her ceaseless care. It is what we give that holds us, not what we receive. If a young man is constantly sending flowers and other little gifts to one he loves before they are married, because he wants to express himself, is it any wonder if his love droops when he suddenly ceases to do such things? If a young woman wishes to wear her prettiest dress when she is to see her lover and if she gladly sings his favorite songs, should she forget to please him when she is his wife? The form of service, what we do for another, may change, but it must not cease. How short-sighted are those people who have kind words and kind deeds for everyone but those they love. There is no place where courtesy is of more value than where it seems superfluous. Why should our work or our business crowd the best things out of our lives? Shall our hearts be so filled with plans and bargains and daily cares that those in our homes are forgotten?

In boiling or steaming puddings never allow the water to stop bubbling for more than a moment. Have ready boiling water to pour immediately into the kettle when the water begins to boil down.

SHIRT WAIST BOX.

Every girl needs a little box in which to keep her shirt waists. If it has to be in the bedroom, the top can be used for several purposes. Much care should be taken to put on the outside covering neatly, and to have the coloring harmonize with the rest of the things in the room.

Perhaps you have an old box that can be remodeled by one of the men of the household; if not, get a thin wooden cracker box. It should not cost over ten cents. Most grocers are glad to give them away. Fasten on the cover with neat brass hinges, costing about ten cents. For covering use pretty, flowered cretonne, plain burlap or even denim, which can be fastened to the box with fish glue. Don't use any more than you need, as the odor is unpleasant. Sew some little pockets to the lining of the cover before it is glued on, they can be used for odds and ends. These little boxes are sold in large stores for three to five dollars. Shirtwaists that are hung on a nail in the closet do not always give the wearer a neat appearance. —The Ranch.

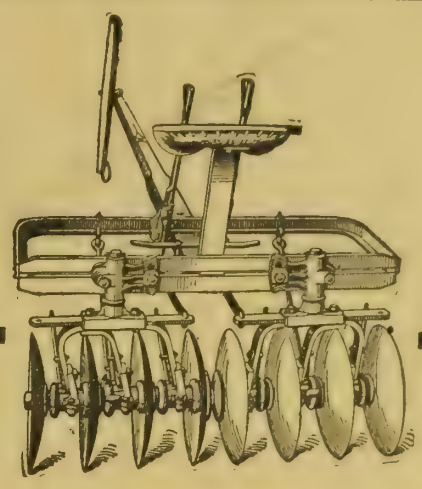
ORANGE DESERT.

Remove the skin and fiber from six oranges, then cut the pulp into small blocks; peel and dice three bananas; peel and cut a medium-sized pineapple first into rounds, then into small, wedge-shaped sections. Stand the prepared fruit in a cold place to chill. At serving time, arrange on individual salad plates as follows: First, around the outer edge a border of pineapple; inside this a row of orange blocks, then fill up the center with the diced bananas, heaped up to form a tiny mound. Finish off the top of the mound with a fine, fresh strawberry or a marashino cherry; sprinkle with sugar, and add at the last moment one tablespoonful of grape juice to each serving.

THE CHIN AND THROAT.

Remember always to arch the throat, almost as a horse does. If a woman, talking to some one, turns her shoulders slightly from him, and then glances back, the line of the throat is always good. For myself, I have at all times thought the delicate line from the tip of a woman's ear to the tip of her shoulder one of the most exquisite of the feminine body. Many artists, I believe, would agree with me. So remember what I say, dear ladies—do not spoil or hide that lovely contour with high linen collars or boning. Wear low collars, or if these are not becoming to you at least dress your throats comfortably.

Always carry the chin high. If, while you are still quite young, you can remember to thrust the chin upward and forward—not to an absurd degree, of course—you will not, with advancing years, have to fear those soft rolls of flesh above the collar that add so much to a woman's apparent age.—Anna Pavlova, in Harper's Bazar.



Cotton King Disk Harrow

This harrow is symmetrical in design and strong enough to withstand the heavy work which a disk harrow encounters in a field. It is equipped with three steel standards, which insures great strength and will not clog when working over freshly-plowed ground or among clods. It will work equally well in any condition of soil, no matter whether the field is sandy or soggy. The gangs respond promptly to the levers so that the driver can easily adjust the disks to work at any desired angle. The frame is high and the disks can be so extended that there will be ample room for passing the plants when using the harrow as a cultivator. The levers do not extend below the tongue where they would interfere with the plants being cultivated. This disk harrow is just what you need. Come and investigate.

Correct Grinding

of corn on cob is easily accomplished with the

Fairbanks-Morse Steel Feed Mill

The high price of feed makes it important that you do your feeding on a scientific basis. FAIRBANKS-MORSE FEED MILLS are best on account of their light draft, large capacity, strength and long life. They are designed for slow speed, which reduces friction and wear. A 2 H.-P. Jack-of-all-Trades Engine will run one of these mills, crushing ear corn and grinding it fine in one operation. Shelled corn or other small grains, separate or mixed, can be ground fine in one operation. Made in two sizes: Sacking Elevator can be used with either size. *Moderate price; greatest value ever offered.* Send for Fairbanks-Morse Feed Mill Catalog, No. LD 113 which also shows corn shellers and Fodder cutter.

FARMERS RALLY.

The people of Laton who are particularly interested in the development of that section have an aspiration to hold an agricultural fair the coming fall. To the end that it may be as successful as possible, a committee has written to the State University to learn what encouragement it will lend along this line. The idea is to raise locally several hundreds of dollars for cash premiums for best breeding animals, best quality of seeds, plants and products—in other words, a genuine county fair premium list. Competition is to be open to immediately surrounding sections. The community has one of the finest locations for such expositions and fairs, and with a little encouragement it could be made a complete success. It has been suggested that a farmers institute be held in connection. Commenting on the idea, when requested for advice, Mrs. Sherman has written:

"The idea seems a good one if the local people can be induced to exhibit largely. The difficulty of securing live stock from outside is great unless large prizes are offered. The expense of handling stock away from home is much greater than anyone realizes that has not taken stock to fairs. The advertising is often thought to help the breeders, but it is a fact that one-third the money expended to fit an animal for the ring and exhibit him will sell him if used to advertise in the papers.

"While as far as the funds permit the University is always willing to send judges for live stock, yet to escape criticism the classes must be large enough to justify the expense. When only a few animals are assembled it is not considered as educational to merely decide between two specimens of a breed which is best.

"A farmers institute does not fit in very well with a fair, for to the farmer a fair is playtime, while an institute is work. Now, as a suggestion, how would a farmers rally answer for the first year? Invite the farmers to bring horses for prizes, including a class for family horses and a pony class for the children. Have a few cows, also. These cows could be milked the night before at the grounds, and in the morning, and the milk tested for fat. Then in the afternoon have a few speakers from the University to talk on cow, horse and pig, and another on cereals and alfalfa growing. This would cost a trifle and could be held in the beautiful grove for one day. If this was a success this time, then next time a two days or three days affair could be arranged. The greatest difficulty in these affairs is they are started too big; the work falls on a few, and they are not likely to want to repeat the experience."

TEDDY'S QUERY.

One brother was tall and slim,
The other chubby and short—
Teddy sat looking at them one night,
Apparently lost in thought.

"Mamma," he asked at length,
"Which you would like the best—
For me to grow north and south like Tom,
Or like Willie, from east to west?"

COOL WATER IN THE HOT SUN
"NO, MR SUN"
YOU CAN'T WARM THE WATER IN THE APPELL WATER BAG
APPELL'S
SOUTH AFRICAN WATER BAG
THE ADAM APPELL CO.
PORTLAND OREGON

APPELL'S South African WATER BAG

Keeps water cool 48 hours or longer, in sun or shade: great boon to prospectors, surveyors, sportsmen, stockmen, farmers, teamsters, anyone exposed to dry or warm weather. Used by U. S. Gov't. Strong, light, easy to carry. Guaranteed

Take no Substitute

This Letter Typifies the Attitude of All Users

Gentlemen: Elkhart, Indiana.

While in Nevada recently I had occasion to drink out of one of your South African Water Bags. Water from the bag certainly tastes good on the desert. We used one of your 2½ gallon bags and *the water remained cool all day, even though the temperature was over 100 in the shade*, and in the morning I found the water sparkling and as cold as ice water. It certainly is a boon to those living in the arid regions.

Yours Sincerely, W. E. WIDER

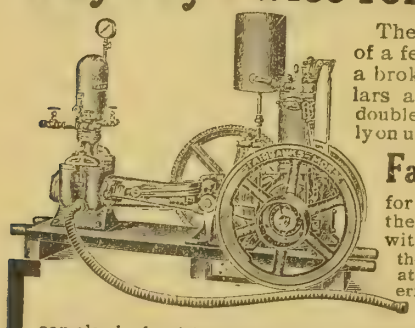
Why Pay Twice for Your Spray Outfit?



The lack of sufficient pressure or the loss of a few days' time in spraying season from a broken-down outfit will cost you many dollars at the end of the season—more than double the cost of your spray outfit. Is it safe to rely on unknown outfits when you can get a reliable

Fairbanks-Morse Spray Outfit

for almost the same price? They put you on the safe side and insure your crop. Equipped with the well-known **Fairbanks-Morse** engine, they give an abundance of power and operate at the lowest cost. Then you can use this powerful engine for your work, such as pumping water, sawing wood, etc. Operates on gasoline, kerosene, distillate or alcohol. Outfit can also be furnished mounted on trucks with tower and tank complete.
